

the most powerful locomotives. Although in history, their haulage on the mountains of West Virginia is legendary.

The N&W's main line was 663 miles long, stretching from Norfolk, Virginia, to Columbus, Mo. It was on the climb, over the mountains, a 66 gradient of the Allegheny mountains, that on the numerous colliery branches in the Virginia valleys, that the 2-8-8-2 Mallet articulated compound engine designed for 40 years.

1918, the N&W built
and Mallet

1918, the N&W built its prototype 2-4-4-2 locomotive and Mallet, classified Y2, in the Wisconsin shops. This was an enlargement of the successful Z1 class 2-4-6-2s of the Chesapeake & Ohio Railway.

By the end of 1924, the N&W had a fleet of 1 Class Y2 and Y3 2-8-8-2s, built by their own workshops at Roanoke as well as by private builders, the Y3 being the United States Railway Administration (USRA) derivative of the N&W Y2. A further 10 of these locomotives, Class Y4, were added in 1927. These were given bolstered side frames and cross ties to increase efficiency and power length.

The N&W Mallets were provided with a non-
 ing valve, enabling them to operate as low-
 linder simple expansion locomotives. As the

The Y8Bs were of the Mallet type, pioneered by the Swiss-born engineer of that name. The UP cylinders and driving wheels were mounted in a separate frame hinged from the main frame. This feature enabled large and powerful locomotives to have greater flexibility in negotiating curved tracks, of which the N&W had many.

the exhaust from the high pressure (HP) cylinder is taken directly to the blowpipe, instead of through the low pressure (LP) cylinders as normal. This reduces the pressure on the HP pistons and reduces the wear on the HP pistons and the blowpipe.

During 1930-32, Roanoke built 30 Class Y5 engines. In these, the boiler pressure was increased from 240 to 300psi — a high figure for that time. By enlarging the firebox, the grate area was enlarged from 56 to 106sq ft. This increased the capacity of the heating surface and evaporative capacity of the locomotive. By enlarging the LP piston valves from 14 to 18in diameter and providing larger bridge exhaust pipes from the LP cylinders to give free exhaust, the steam flow was improved for higher power outputs at speed.

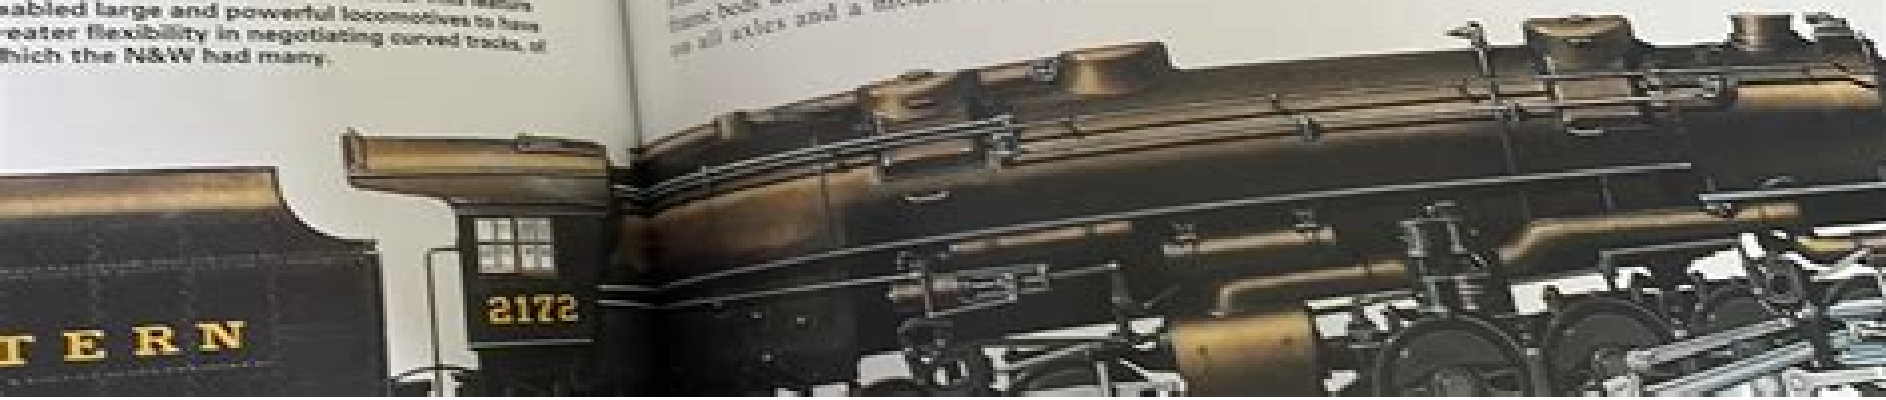

The Y's set the basic pattern for the classic Y6 ones, of which 35 were produced during 1936-40. This class had the added refinement of cast-steel frame beds with integral cylinders, roller bearings on all axes and a modified valve setting to

increase power. In 1942, N&W once again modified the design and 16 Vya engines incorporated an improved type of mechanical stirrer (an essential feature on locomotives burning up to 6 or 7 tons of coal per hour) and plain instead of roller bearings for the tender axles.

Last of the line

In 1948, just as the big three commercial US locomotive builders, Alco, Lima and Baldwin, were fulfilling their final domestic steam orders, Roanoke embarked on the construction of a further series of compound 2-8-8-2s. Ultimately, 30 were built, classified Y6b, and numbered 2471 to 2500.

Compared to the earlier Y6 engine, refinements included increased carbon heating surface and volume, the combustion chamber being extended by 4 in. and the tube length correspondingly reduced. This resulted in better fuel combustion and increased evaporation. The blaspice or
