regional investigations were carried out to analyse landslide characteristics in the Swabian Alb region and to develop prototypic landslide early warning systems. In the local study area, an extensive hydrological and slope movement monitoring system was installed on a seasonally reactivated landslide body located in Lichtenstein Unterhausen. Monitoring data was analysed to assess the influence of rainfall and snow melt on groundwater conditions and the initiation of slope movements. The coupled hydrology slope stability model CHASM was applied to detect areas most prone to slope failures and to simulate slope stability using a variety of input data. Subsequently, CHASM was refined and two web-based applications were developed: a technical early warning system to constantly simulate slope stability integrating rainfall measurements, hydrological monitoring data and weather forecasts; and a decision support system allowing for quick calculation of stability for freely selectable slope profiles. On the regional scale, available landslide inventory data were analysed for their use in evaluation of rainfall thresholds proposed in other studies. Adequate landslide events were selected and their triggering rainfall and snow melting conditions were compared to intensity duration and cumulative thresholds. Based on the results, a regional landslide early warning system was developed and implemented as a web-based application. Both the local and the regional landslide early warning systems are part of a holistic and integrative early warning chain developed by the ILEWS project and could easily be transferred to other landslide-prone areas.

Rainwater Tank Systems for Urban Water Supply
Ashok K. Sharma, Donald Begbie, Ted Gardner, 2015-05-15

Rainwater tank systems have been widely adopted across the world to provide a safe local source of water in underdeveloped rural areas, a substitution for mains water for non-potable end uses in water-stressed urban areas as well as providing flooding control in monsoonal climates such as Korea or combined sewer systems such as Germany. The importance of these systems in cities has grown as water managers seek to provide a range of decentralised solutions to supply constraints of current water supply systems whilst reducing the impact of urban development on the natural environment and increasing resilience to the impacts of climate change. Rainwater tank systems are now often implemented under integrated urban water management (IUWM) and water sensitive urban design (WSUD) philosophies which take a holistic view of the urban water cycle. *Rainwater Tank Systems for Urban Water Supply* is based on a comprehensive multi-million dollar research program that was undertaken in South East Queensland (SEQ), Australia, in response to the Millennium drought when the water supply level in the region's drinking water dams dropped to 17% in July 2007 and the area came close to running out of water. In particular, the book provides insights and detailed analysis of design, modelling, implementation, operation, energy usage, economics, management, health risk, social perceptions and implications for water quality and quantity of roof water runoff. The approaches and methodologies included in *Rainwater Tank Systems for Urban Water Supply* inform and validate research programs and provide insights on the expected performance and potential pitfalls of the adoption of rainwater tanks systems, including actual harvested yield and resulting mains water savings, optimal sizing for rainwater storages and roof collection systems, expected water quality and implications for managing public health risks.

modelling tools available for decision support operation and management approaches of a decentralised asset at the household scale and community acceptance The book is suitable for use at undergraduate and post graduate levels and is of particular interest to water professionals across the globe who are involved in the strategic water planning for a town city or a region It is a valuable resource for developers civil designers water planners architects and plumbers seeking to implement sustainable water servicing approaches for residential industrial and commercial developments **ICSBE 2018** Ranjith Dissanayake, Priyan Mendis, 2019-08-06 This book highlights current research and development in the area of sustainable built environments currently one of the most important disciplines in civil engineering It covers a range of topics including sustainable construction and infrastructures waste and wastewater management enhanced sustainability renewable and clean energy sustainable materials and industrial ecology building automation and virtual reality and impact of climate change As such it provides vital insights into responsible urbanization practices and new tools and technologies in civil engineering that can mitigate the negative effects of the built environment
