*Selection and Breeding Programs in Aquaculture* Trygve Gjerdem,2005-04-13 Although aquaculture as a biological production system has a long history systematic and efficient breeding programs to improve economically important traits in the farmed species have rarely been utilized until recently except for salmonid species This means that the majority of aquaculture production more than 90 % is based on genetically unimproved stocks In farm animals the situation is vastly different practically no terrestrial farm production is based on genetically unimproved and undomesticated populations This difference between aquaculture and livestock production is in spite of the fact that the basic elements of breeding theory are the same for fish and shellfish as for farm animals One possible reason for the difference is the complexity of reproductive biology in aquatic species and special consideration needs to be taken in the design of breeding plans for these species Since 1971 AKVAFORSK has continuously carried out large scale breeding research projects with salmonid species and during the latest 15 years also with a number of fresh water and marine species Results from this work and the results from other institutions around the world have brought forward considerable knowledge which make the development of efficient breeding programs feasible The genetic improvement obtained in selection programs for fish and shellfish is remarkable and much higher than what has been achieved in terrestrial farm animals

**Genetics of Subpolar Fish and Invertebrates** Anthony J. Gharrett,Richard G. Gustafson,Jennifer L. Nielsen,James E. Seeb,Lisa W. Seeb,William W. Smoker,Gary H. Thorgaard,Richard L. Wilmot,2012-12-06 Fisheries genetics researchers will find invaluable the thirty eight peer reviewed contributions in this book presented at the 20th Lowell Wakefield Fisheries Symposium Genetics of Subpolar Fish and Invertebrates held in May 2002 in Juneau Alaska Looming over concerns of lost fisheries stocks and persistent erosion of genetic variability are predictions of global warming which may further tax genetic resources One consequence is an increased reliance on genetic applications to many aspects of fisheries management aquaculture and conservation The contributions in this book are important to modern fisheries science and genetics and illustrate the evolution of the field over the past decade The improved technology provides tools to address increasingly complicated problems in traditional applications and ecological and behavioral studies The union between molecular and quantitative genetics where many of the major questions about population structure and evolution remain unanswered will also benefit from the new technologies
