

Foreword

Numerical Analysis 2000 Vol. III: Linear Algebra

With the year 2000 being elected “The World Mathematical Year”, the Journal of Computational and Applied Mathematics decided to publish a series of volumes dedicated to various disciplines of applied mathematics and numerical analysis. The series received the ambitious title “Numerical Analysis in the 20th Century” and contains seven volumes of which the present one is devoted to “Linear Algebra”.

From the early days of scientific computing, numerical linear algebra has been driven by the necessity to be able to solve linear systems, to solve eigenproblems, and to understand the meaning of the results. Because many of these problems have to be solved repeatedly in other computational problems, the algorithms have to be robust and as fast as possible. This has led to much activity, and other than only developing algorithms on demand, the involved research has been equally intellectually challenging as in other sciences. The behavior of algorithms under rounding errors was a great source of inspiration for the further development of perturbation theory.

Also, the possibility and the necessity to solve larger problems has led to algorithms for the reduction of the information to lower dimensional subspaces. The theories of iterative methods have been pushed forward by curiosity-driven research as well as by strong pressure from applications.

Numerical analysis and numerical linear algebra in particular, have strongly contributed to the giant leaps that could be made, in scientific computing in recent decades. The scientific problems that can be solved nowadays are bigger by many orders of magnitude than those that could be solved, say, some 30 years ago. Roughly, half of the increased computational power must be attributed to improved algorithms, and the other half has been made possible by the increase of computational speeds in hardware. This impressive increase in scale of computation has led to more complicated applications and this in turn has led to more complicated numerical linear algebra problems, such as Kronecker structures, highly nonnormal matrices, ill-posed problems, nonlinear eigenproblems, etc.

At this point in time, we can conclude that numerical linear algebra has reached a certain level of maturity. There is a solid theoretical basis for the study of various phenomena and the theory is still in flux. There have been times, not so long ago, when leading researchers believed that the theory for this area was more or less complete and that further progress in scientific computing was simply a matter of scaling. Simply stated: one had only to increase the order of the problem and to implement the well-known algorithms efficiently on modern computers. It has turned out that this was a too simple and too pessimistic point of view. Not only have we seen new challenging
