World population is growing at an alarming rate and may exceed 9.7 billion by 2050, whereas agricultural productivity has been negatively affected due to yield limiting factors such as biotic and abiotic stresses as a result of global climate change. Wheat is a staple crop for 20% of the world population and its yield needs to be augmented correspondingly in order to satisfy the demands of our increasing world population. Green revolution, the introduction of semi dwarf high yielding wheat varieties along with improved agronomic management practices, gave rise to a substantial increase in wheat production and self sufficiency in developing countries that include Mexico, India and other south Asian countries. Since the late 1980s, however, wheat yield is at a standoff with little fluctuation. The current trend is thus insufficient to meet the demands of an increasing world population. Therefore, while conventional breeding has had a great impact on wheat yield, with climate change becoming a reality, newer molecular breeding and management tools are needed to meet the goal of improving wheat yield for the future. With the advance in our understanding of the wheat genome and more importantly the role of environmental interactions on productivity, the idea of genomic selection has been proposed to select for multi genic quantitative traits early in the breeding cycle. Accordingly, genomic selection may remodel wheat breeding with gain that is predicted to be 3 to 5 times that of crossbreeding.

Phenomics high throughput phenotyping is another fairly recent advancement using contemporary sensors for wheat germplasm screening and as a selection tool. Lastly CRISPR Cas9 ribonucleoprotein mediated genome editing technology has been successfully utilized for efficient and specific genome editing of hexaploid bread wheat. In summary there has been exciting progresses in the development of non GM wheat plants resistant to biotic and abiotic stress and or wheat with improved nutritional quality. We believe it is important to highlight these novel research accomplishments for a broader audience with the hope that our readers will ultimately adopt these powerful technologies for crops improvement in order to meet the demands of an expanding world population.

*Proteomics in Foods* Fidel Toldrá, Leo M. L. Nollet, 2012-12-16. Food proteomics is one of the most dynamic and fast developing areas in food science. The goal of this book is to be a reference guide on the principles and the current and future potential applications of proteomics in food science and technology. More specifically the book will discuss recent developments and the expected trends of the near future in food proteomics. The book will be divided into two parts. The first part 7 chapters will focus on the basic principles for proteomics e.g sample preparation such as extraction and separation techniques analytical instrumentation currently in use and available databases for peptide and protein identification. The second part of the book 26 chapters will focus on applications in foods. It will deal with quality issues related to post mortem processes in animal foods and quality traits for all foods in general as well as the identification of bioactive peptides and proteins which are very important from the nutritional point of view. Furthermore consumers are now extremely susceptible to food safety issues and proteomics can provide reassurance with different safety aspects such as food authenticity detection of animal species in the food and identification of food allergens. All of these issues will be covered in this book. It is also worth noting that both editors are internationally recognized experts in the field of food science and both have edited numerous food science books and handbooks.

**Animal Sourced Foods for Developing Economies** Muhammad Issa Khan, Aysha Sameen, 2018-12-21. Animal products are good source of disposable income for many small farmers in developing countries. In fact livestock are often the most important cash crop in many small holder mixed farming systems. Livestock ownership currently supports and sustains the livelihoods of rural poor who depend partially or fully on livestock for their income and or subsistence. Human population growth increasing urbanization and rising incomes are predicted to double the demand for and production of livestock products in the developing countries over the next twenty years. The future holds great opportunities for animal production in developing countries. Animal Sourced Foods for Developing Economies addresses five major issues: 1 Food safety and nutritional status in developing world 2 the contribution of animal origin foods in human health 3 Production processes of

animal foods along with their preservation strategies 4 functional outcomes of animal derived foods and finally 5 strategies issues and policies to promote animal origin food consumption Animal sourced food contain high biological value protein and important micronutrients required for optimal body functioning but are regarded as sources of fat that contribute to the intake of total and saturated fatty acids in diet The quality of protein source has a direct influence on protein digestibility as a greater proportion of higher quality proteins is absorbed and becomes available for bodily functions Animal foods has high quantity and quality of protein that includes a full complement of the essential amino acids in the right proportion Land availability limits the expansion of livestock numbers in extensive production systems in most regions and the bulk of the increase in livestock production will come from increased productivity through intensification and a wider adoption of existing and new production and marketing technologies The significant changes in the global consumption and demand for animal source foods along with increasing pressures on resources are having some important implications for the principal production systems In this book contributors critically analyze and describe different aspects of animal s origin foods Each chapter is dedicated to a specific type of food from animal source its nutritional significance preservation techniques processed products safety and quality aspects on conceptual framework Special attention is given to explain current food safety scenario in developing countries and contribution of animal derived food in their dietary intake Existing challenges regarding production processing and promotion of animal s origin foods are also addressed with possible solutions and strengthening approaches
