## **Number Theory And Its Applications In China:**

*Number Theory and Its Applications in China* Yuan Wang, 1988 Emphasizes the accomplishments of Chinese number theorists during 1949-1979 a period when correspondence between China and other countries was discouraged This work presents a survey of the significant contributions of Chinese mathematicians It also reflects the developments and state of research in number theory in China

Number Theory and Its Applications in China Yuan Wang, Chung-Chun Yang, Chengbiao Pan, 1988-12-31 Of all modern mathematical forms number theory is one of the earliest to be explored in China and is the one to which the Chinese have made their greatest contributions Yan Wu zhi first introduced number theory into China in the 1920s Particularly influential in the field was Hua Loo keng who studied with G H Hardy and made significant contributions in the areas estimating complete exponential sums Waring's problems Tarry's problems and Vinogradov's method Interest in number theory continued to flourish following the founding of the People's Republic of China The most noted accomplishments by Chinese mathematicians were focused on the solution of Goldbach's Conjecture and on the sieve method Although the Cultural Revolution interrupted research in number theory for more than 10 years the field is now growing in China A number of universities now have advanced programs in the subject and a wide variety of topics including the applications of number theory This volume contains nine survey articles and three articles on current research The collection emphasizes the accomplishments of Chinese number theorists during 1949-1979 a period when correspondence between China and other countries was discouraged The collection is intended not only to survey the significant contributions of Chinese mathematicians but also to reflect the latest developments and current state of research in number theory in China

Number Theory And Its Applications Li Hailong Li, Fuhuo Li, Nianliang Wang, Shigeru Kanemitsu, 2017-11-29 The aim of the book is to give a smooth analytic continuation from basic subjects including linear algebra group theory Hilbert space theory etc to number theory With plenty of practical examples and worked out exercises and the scope ranging from these basic subjects made applicable to number theoretic settings to advanced number theory this book can then be read without tears It will be of immense help to the reader to acquire basic sound skills in number theory and its applications Number theory used to be described as the queen of mathematics that is there is no practical use However with the development of computers and the security of internet communications the importance of number theory has been exponentially increasing daily The raison d'être of the present book in this situation is that it is extremely reader friendly while keeping the rigor of serious mathematics and in depth analysis of practical applications to various subjects including control theory and pseudo random number generation The use of operators is prevailing rather abundantly in anticipation of applications to electrical engineering allowing the reader to master these skills without much difficulty It also delivers a very smooth bridging between elementary subjects including linear algebra and group theory and algebraic number theory for the reader to be well versed in an efficient and effortless way One of the main features of the book is that

it gives several different approaches to the same topic helping the reader to gain deeper insight and comprehension Even just browsing through the materials would be beneficial to the reader

theory of commuting systems      **Enumerative Algebraic Geometry** Steven L. Kleiman, Anders Thorup, 1991 1989 marked the 150th anniversary of the birth of the great Danish mathematician Hieronymus George Zeuthen Zeuthen's name is known to every algebraic geometer because of his discovery of a basic invariant of surfaces However he also did fundamental research in intersection theory enumerative geometry and the projective geometry of curves and surfaces Zeuthen's extraordinary devotion to his subject his characteristic depth thoroughness and clarity of thought and his precise and succinct writing style are truly inspiring During the past ten years or so algebraic geometers have reexamined Zeuthen's work drawing from it inspiration and new directions for development in the field The 1989 Zeuthen Symposium held in the summer of 1989 at the Mathematical Institute of the University of Copenhagen provided a historic opportunity for mathematicians to gather and examine those areas in contemporary mathematical research which have evolved from Zeuthen's fruitful ideas This volume containing papers presented during the symposium as well as others inspired by it illuminates some currently active areas of research in enumerative algebraic geometry      *A History of Chinese Mathematics* Jean-Claude Martzloff, 2007-08-17 This book is made up of two parts the first devoted to general historical and cultural background and the second to the development of each subdiscipline that together comprise Chinese mathematics The book is uniquely accessible both as a topical reference work and also as an overview that can be read and reread at many levels of sophistication by both sinologists and mathematicians alike      The Connection between Infinite Dimensional and Finite Dimensional Dynamical Systems Basil Nicolaenko, Ciprian Foias, Roger Temam, 1989 The last few years have seen a number of major developments demonstrating that the long term behavior of solutions of a very large class of partial differential equations possesses a striking resemblance to the behavior of solutions of finite dimensional dynamical systems or ordinary differential equations The first of these advances was the discovery that a dissipative PDE has a compact global attractor with finite Hausdorff and fractal dimensions More recently it was shown that some of these PDEs possess a finite dimensional inertial manifold that is an invariant manifold containing the attractor and exponentially attractive trajectories With the improved understanding of the exact connection between finite dimensional dynamical systems and various classes of dissipative PDEs it is now realistic to hope that the wealth of studies of such topics as bifurcations of finite vector fields and strange fractal attractors can be brought to bear on various mathematical models including continuum flows Surprisingly a number of distributed systems from continuum mechanics have been found to exhibit the same nontrivial dynamic behavior as observed in low dimensional dynamical systems As a natural consequence of these observations a new direction of research has arisen detection and analysis of finite dimensional dynamical characteristics of infinite dimensional systems This book represents the proceedings of an AMS IMS SIAM Summer Research Conference held in July 1987 at the University of Colorado at Boulder Bringing together mathematicians and physicists the conference provided a forum for presentations on the latest developments in the field and fostered lively interactions on open questions and future directions With

contributions from some of the top experts these proceedings will provide readers with an overview of this vital area of research

**Mathematics of Nonlinear Science** Melvyn Stuart Berger, 1990 Contains the proceedings of an AMS Special Session on the Mathematics of Nonlinear Science held in Phoenix in January 1989 The area of research encompasses a large and rapidly growing set of ideas concerning the relationship of mathematics to science in which the fundamental laws of nature are extended beyond common sense into new areas where the dual aspects of order and chaos abound
