Reeler Mouse As A Model Of Brain Development:

The Reeler Mouse as a Model of Brain Development Catherine Lambert de Rouvroit, Andre M. Goffinet, 2013-03-12
Only five years ago nobody in his right mind would have considered publishing a book on reeler as a model for brain development. Although this interesting mutation has been with us for half a century it is fair to say that in spite of a wave of enthusiasm in the late sixties and early seventies generated primarily by Sidman Caviness and colleagues studies of reeler mice fell progressively out of fashion during the next two decades. All that changed almost overnight when the cloning of the reeler gene, dubbed *reelin*, was reported in Tom Curran's laboratory in 1995. The fact that the same gene was identified at the same time independently by two other groups using positional cloning suggested strongly that *reelin* was the right candidate. Although the key experiments of transgenic rescue have not been made and perhaps will never be, the equation *reeler* is *reelin* has been established beyond reasonable doubt as alterations of the *reelin* gene and/or its expression have been found in at least five alleles of *reeler* and in the mutation *Shaking Rat* (Kawasaki SRK), an ortholog of *reeler*.

Andre M. Goffinet, Pasko Rakic, 2012-08-10 Our understanding of the molecular mechanisms involved in mammalian brain development remains limited. However, the last few years have witnessed a quantum leap in our knowledge due to technological improvements, particularly in molecular genetics. Despite this progress, the available body of data remains mostly phenomenological and reveals very little about the grammar that organizes the molecular dictionary to articulate a phenotype. Nevertheless, the recent progress in genetics will allow us to contemplate for the first time the integration of observation into a coherent view of brain development. Clearly, this may be a major challenge for the next century and arguably is the most important task of contemporary developmental biology. The purpose of the present book is to provide an overview that synthesizes up-to-date information on selected aspects of mouse brain development. Given the format, it was not possible to cover all aspects of brain development and many important subjects are missing. The selected themes are to a certain extent subjective and reflect the interests of the contributing authors. Examples of major themes that are not covered are peripheral nervous system development, including myelination, the development of the hippocampus, and several other CNS structures, as well as the developmental function of some important morphoregulatory molecules.
Brain Development and Cognition Mark H. Johnson, Yuko Munakata, Rick O. Gilmore, 2008-04-15 The first edition of this successful reader brought together key readings in the area of developmental cognitive neuroscience for students. Now updated in order to keep up with this fast-moving field, the volume includes new readings illustrating recent developments along with updated versions of previous contributions. Michael W. Miller, 2006-04-06 This is the first book about both normal development of the nervous system and how early exposure to alcohol and nicotine interferes with this development. The developing nervous system is highly dynamic and vulnerable to genetic and epigenetic factors that can be additive or

synergistic Disruption of normal brain development leads to an array of developmental disorders One of the most common of these is mental retardation the prime cause of which is prenatal exposure to alcohol As chapters in this book show alcohol has direct effects on the developing neural system and it affects genetic regulation Another common neurotoxin is nicotine and it is discussed in this book for three reasons 1 the number of adolescents who smoke cigarettes is rising in some populations 2 prenatal exposure to nicotine affects neurotransmitter systems that are critical for normal brain development and cognition and 3 prenatal exposure to nicotine is often accompanied by prenatal exposure to alcohol LThe mature brain is the culmination of an orderly sequence of the basic ontogenetic processes cell proliferation migration differentiation and death Neural stem cells and progenitors proliferate in discrete sites then young neurons migrate long distances to their residences where they form neural networks During this sequence many immature cells die presumably eliminating unsuitable or non competitive cells Each process is regulated by genetic and environmental factors When this regulation goes awry a dysmorphic and dysfunctional brain results Though this can be tragic in clinical settings in experimental contexts it provides keen insight into normal brain development LThe book is divided into three parts The first describes neural ontogeny in the normal brain The second and third deal with the consequences of early exposure to alcohol and nicotine Though there are similarities in the effects of these two toxins there are also intriguing differences The commonalities reflect the plasticity and resilience of the developing brain while the differences point to the targeted effects of the two toxins Exploring these effects brings a richer appreciation of brain development The book will be of interest to neuroscientists developmental biologists teratologists pharmacologists toxicologists neurologists neuropsychologists and to their students and trainees

Reelin-Related Neurological Disorders and Animal Models Laura Lossi,Adalberto Merighi,Gabriella D'Arcangelo,2017-03-14 The Reeler mutation was so named because of the alterations in gait that characterize homozygous mice Several decades after the description of the Reeler phenotype the mutated protein was discovered and named Reelin Reln Reln controls a number of fundamental steps in embryonic and postnatal brain development A prominent embryonic function is the control of radial neuronal migration As a consequence homozygous Reeler mutants show disrupted cell layering in cortical brain structures Reln also promotes postnatal neuronal maturation Heterozygous mutants exhibit defects in dendrite extension and synapse formation correlating with behavioral and cognitive deficits that are detectable at adult ages The Reln encoding gene is highly conserved between mice and humans In humans homozygous RELN mutations cause lissencephaly with cerebellar hypoplasia a severe neuronal migration disorder that is reminiscent of the Reeler phenotype In addition RELN deficiency or dysfunction is also correlated with psychiatric and cognitive disorders such as schizophrenia bipolar disorder and autism as well as some forms of epilepsy and Alzheimer s disease Despite the wealth of anatomical studies of the Reeler mouse brain and the molecular dissection of Reln signaling mechanisms the consequences of Reln deficiency on the development and function of the human brain are not yet completely

understood This Research Topic include reviews that summarize our current knowledge of the molecular aspects of Reln function original articles that advance our understanding of its expression and function in different brain regions and reviews that critically assess the potential role of Reln in human psychiatric and cognitive disorders Developmental Neurobiology Mahendra S. Sharma,A.M.

Goffinet,2012-12-06 the major theme of this book is the development of the vertebrate central nervous system. This volume contains summaries of most of the invited participants at the NA advanced study institute entitled Development of central nervous system in vertebrates held in Maratea Italy from June 23 to July 5 1991. In order to address this topic we have drawn upon a selection of current studies dealing with molecular cellular and system analysis which specifically pertain to the general principles of the development. The major aim of this institute was to bring together a select group of investigators who would present their views on the current issues in their respective fields and to foster extensive discussions amongst participants in smaller groups. Such interactions brought together the exchanges of ideas amongst participants and helped clarify the intricate details and formulate new vistas and collaborations. Since the study of nervous system development has focused mostly on the origin of neuron and glia cells the area of current research was represented by talks on early cellular events including effects of growth factors, BDNF and other gene expressions and cell lineage of specific cell types. Formation of specific cell types and the specific neuronal connections have been a major theme in the study of the nervous system development. Recent technical advances have resulted in new information at both cellular and molecular levels which have provided new details. Current research was represented by selective topics discussed at the meeting.

Cumulated Index Medicus, 1995 **Stem and Progenitor Cells in the Central Nervous System** R.S. Nowakowski, 2004 This publication focuses on the biology of stem and progenitor cells in the developing and mature central nervous system, their response to trauma and potential uses in therapy. The authors, who are leading experts in the field, address topical questions from both basic and clinical neuroscience perspectives such as non-invasive imaging of stem cell division, the origins of regional diversity in cell types and cell numbers in the stem cell progeny, factors that regulate generation of neurons and glial cells from stem cells during normal development, the role of genetic and environmental factors in the regulation of stem cell function, the role of stem cells in mediating the effects of brain trauma and its recovery and the therapeutic uses of stem cells. Offering a unique compilation of articles on the biology and the therapeutic applications of stem cells in the embryonic and mature nervous systems, this volume will be of great value to neuroscientists, developmental biologists, cancer biologists and clinical neurologists.
