Pricing Communication Networks Economics Technology And Modelling:

Pricing Communication Networks Costas Courcoubetis, Richard Weber, 2003-07-25 Traditionally engineers devised communication services without reference to how they should be priced. In today's environment pricing is a very complex subject and in practice depends on many parameters of the actual market including amount of traffic, architecture of the network, technology and cost. The challenge is to provide a generic service model which accurately captures aspects such as quality and performance and can be used to derive optimal pricing strategies. Recent technology advances combined with the deregulation of the telecommunication market and the proliferation of the internet have created a highly competitive environment for communication service providers. Pricing is no longer as simple as picking an appropriate model for a particular contract. There is a real need for a book that explains the provision of new services, the relation between pricing and resource allocation in networks and the emergence of the internet and how to price it. *Pricing Communication Networks* provides a framework of mathematical models for pricing these multidimensional contracts and includes background in network services and contracts, network technology, basic economics and pricing strategy. It can be used by economists to fill in the gaps in their knowledge of network services and technology and for engineers and operational researchers to gain the background in economics required to price communication services effectively. Provides a broad overview of network services and contracts. Includes a primer on modern network technology and the economic concepts relevant to pricing and competition. Includes discussion of mathematical models of traffic flow to help describe network capability and derive pricing strategies. Includes coverage of specialist topics such as regulation, multicasting and auctions. Illustrated throughout by detailed real examples. Suitable for anyone with an understanding of basic calculus and probability. Primarily aimed at graduate students, researchers and practitioners from electrical engineering, computer science, economics and operations research. *Pricing Communication Networks* will also appeal to telecoms engineers working in industry.

Network Economics for Next Generation Networks Peter Reichl, Burkhard Stiller, Bruno Tuffin, 2009-05-07 This book constitutes the refereed proceedings of the 6th International Workshop on Internet Charging and QoS Technologies, ICQT 2009, held in Aachen, Germany, in May 2009, collocated with the IFIP Networking 2009 conference. The 9 revised full papers presented together with the extended abstract of a keynote paper were carefully reviewed and selected from a total of 26 submissions. The papers are organized in topical sections on competition, models, pricing mechanisms and economics of inter-domain traffic. Bringing together researchers from the area of technology and economy in both industry and academia to discuss key improvements and to support further progress in these fields, ICQT 2009 features a combination of micro-economic models, auctions, game-theoretic approaches, peer-to-peer and IMS-based charging.

The Economics of Telecommunication Services Pramode Verma, Fan Zhang, 2020-09-25 This textbook characterizes the economics of telecommunication services from an engineering perspective. The authors bring out the fundamental drivers of the industry and characterize networks from a

graph theoretic perspective including random small world and scale free networks The authors relate the topology of a telecommunication network using circuit and packet switched architectures to throughput and other performance parameters The pricing model proposed in this book is based on the cost of displaced opportunity as opposed to the cost of the elements of the network engaged in delivering a service The displaced opportunity is characterized by the revenue associated with the service that the network could have alternatively delivered most efficiently using an identical level of resources The book addresses other topics such as regulation in legacy networks and net neutrality Finally the book introduces the application of game theory in a multi vendor multi services competitive marketplace The book aims to bridge the gap between the science of economics as practiced by economists and practice of pricing from a telecommunication engineer's perspective This book is suitable for use by senior undergraduate or graduate students of telecommunication engineering or researchers and practitioners in telecommunication engineering

Performance Models and Risk Management in Communications Systems Nalân Gülpınar, Peter G. Harrison, Berc Rustem, 2010-11-02 This volume covers recent developments in the design operation and management of telecommunication and computer network systems in performance engineering and addresses issues of uncertainty robustness and risk Uncertainty regarding loading and system parameters leads to challenging optimization and robustness issues Stochastic modeling combined with optimization theory ensures the optimum end to end performance of telecommunication or computer network systems In view of the diverse design options possible supporting models have many adjustable parameters and choosing the best set for a particular performance objective is delicate and time consuming An optimization based approach determines the optimal possible allocation for these parameters Researchers and graduate students working at the interface of telecommunications and operations research will benefit from this book Due to the practical approach this book will also serve as a reference tool for scientists and engineers in telecommunication and computer networks who depend upon optimization
