Diagnosis of salivary gland disorders K. Graamans,Hans Becker,2012-12-06 Historically disorders of salivary glands tend to be underdiagnosed and overtreated In the vast body of literature on this subject emphasis has usually been put on therapeutic modalities of various diseases of the salivary glands Whereas therapy and pathology have been treated in numerous thorough studies the patho physiology of the salivary glands has remained rather poorly understood Even less attention has been given to the diagnostic methods Until a few decades ago diagnosis consisted mainly of a clinical examination which included the patient s history inspection and palpation These methods remain crucial but a variety of new diagnostic tools have appeared since then Their clinical value is still subject to controversy each method has its advocates and opponents The indications for enrolling a patient at a given point in a series of diagnostic procedures are interpreted differently One of the most striking examples is the use of sialography This has become a classic diagnostic procedure Although sialography is still a useful method it has considerable disadvantages limitations and even contraindications In the major teaching hospitals residents still tend to consider sialography as a panacea for the majority of their diagnostic problems whereas the information provided is actually rather restricted Other modern methods such as CT and MRI have taken over the role of sialography to a certain extent This also applies to ultrasonography and scintigraphy Moreover microbiology sialometry sialochemistry cytology and histopathology may give superior information in certain cases
