Brunner, 2012-12-06 With very few exceptions geodetic measurements use electro magnetic radiation in order to measure directions distances time delays and Doppler frequency shifts to name the main terrestrial and space observables Depending on the wavelength of the radiation and the purpose of the measurements the following parameters of the electromagnetic wave are measured amplitude phase angle of arrival polarisation and frequency Accurate corrections have to be applied to the measurements in order to take into account the effects of the intervening medium between transmitter and receiver The known solutions use atmospheric models special observation programs remote sensing techniques and instrumental methods It has been shown that the effects of the earth's atmospheric envelope present a fundamental limitation to the accuracy and precision of geodetic measurements This applies equally to terrestrial and space applications Instrumental accuracies are already below the atmospherically induced limitations and thus the accuracy demands on the geodetic refraction solutions are entering a new magnitude zone This monograph is primarily devoted to the properties of the atmospheric effects on various geodetic measurements and to their evaluation Ten review papers cover the most pressing aspects of the atmospheric effects on geodetic measurement These state of the art papers were written by eminent specialists in their respective research fields      **Analysis of Refraction Influences in Geodesy Using Image Processing and Turbulence Models** Philipp Flach, 2001      *Third International Symposium on the North American Vertical Datum*, 1985      *Refractional Influences in Astrometry and Geodesy* E.
