Regenerative Medicine I Ioannis V. Yannas,2005-02-10 With contributions by numerous experts **Regenerative Medicine II** Ioannis V. Yannas,2005-03-29 Organ regeneration once unknown in adult mammals is at the threshold of maturity as a clinical method for restoration of organ function in humans Several laboratories around the world are engaged in the development of new tools such as stem cells and biologically active scaffolds Others are taking fresh looks at well known clinical problems of replacement of a large variety of organs Bone skin the spinal cord peripheral nerves articular cartilage the conjunctiva heart valves and urologic organs Still other investigators are working out the mechanistic pathways of regeneration and the theoretical implications of growing back organs in an adult The time has come to present a collection of these efforts from leading practitioners in the field of organ regeneration

Green Gene Technology Armin Fiechter,Christof Sautter,2007-05-09 With contributions by numerous experts *Cell Culture Engineering* Wei-Shu Hu,2006-08-16 Since the introduction of recombinant human growth hormone and insulin a quarter century ago protein therapeutics has greatly broadened the horizon of health care Many patients suffering with life threatening diseases or chronic dysfunctions which were medically untreatable not long ago can attest to the wonder these drugs have achieved Although the first generation of protein therapeutics was produced in recombinant Escherichia coli most recent products use mammalian cells as production hosts Not long after the first production of recombinant proteins in E. coli it was realized that the complex tasks of most post translational modifications on proteins could only be efficiently carried out in mammalian cells In the 1990s we witnessed a rapid expansion of mammalian cell derived protein therapeutics chiefly antibodies In fact it has been nearly a decade since the market value of mammalian cell derived protein therapeutics surpassed that of those produced from E. coli A common characteristic of recent antibody products is the relatively large dose required for effective

therapy demanding larger quantities for the treatment of a given disease This coupled with the broadening repertoire of protein drugs has rapidly expanded the quantity needed for clinical applications The increasing demand for protein therapeutics has not been met exclusively by construction of new manufacturing plants and increasing total volume capacity More portantly the productivity of cell culture processes has been driven upward by an order of magnitude in the past decade

Bioreactor Systems for Tissue Engineering Cornelia Kasper, Martijn van Griensven, Ralf Pörtner, 2009-03-17 The editors of this special volume would first like to thank all authors for their excellent contributions We would also like to thank Prof Dr Thomas Schepers Dr Marion Hertel and Ulrike Kreusel for providing the opportunity to compose this volume and Springer for organizational and technical support Tissue engineering represents one of the major emerging fields in modern biotechnology it combines different subjects ranging from biological and material sciences to engineering and clinical disciplines The aim of tissue engineering is the development of therapeutic approaches to substitute diseased organs or tissues or improve their function Therefore three dimensional biocompatible materials are seeded with cells and cultivated in suitable systems to generate functional tissues Many different aspects play a role in the formation of 3D tissue structures In the first place the source of the used cells is of the utmost importance To prevent tissue rejection or immune response preferentially autologous cells are now used In particular stem cells from different sources are gaining exceptional importance as they can be differentiated into different tissues by using special media and supplements In the field of biomaterials numerous scaffold materials already exist but new composites are also being developed based on

Polymeric natural or xenogenic sources. Moreover, a very important issue in tissue engineering is the formation of tissues under well-defined controlled and reproducible conditions. Therefore, a substantial number of new bioreactors have been developed.

Principles of Regenerative Medicine Anthony Atala, Robert Lanza, James A. Thomson, Robert Nerem, 2010-12-16. Virtually any disease that results from malfunctioning, damaged, or failing tissues may be potentially cured through regenerative medicine therapies by either regenerating the damaged tissues *in vivo* or by growing the tissues and organs *in vitro* and implanting them into the patient. *Principles of Regenerative Medicine* discusses the latest advances in technology and medicine for replacing tissues and organs damaged by disease and of developing therapies for previously untreatable conditions such as diabetes, heart disease, liver disease, and renal failure. Key for all researchers and institutions in Stem Cell Biology, Bioengineering, and Developmental Biology, this is the first of its kind to offer an advanced understanding of the latest technologies in regenerative medicine. New discoveries from leading researchers on restoration of diseased tissues and organs.
