

Stepwise approach to evaluation of recurrent pregnancy loss

1. Evaluate for fetal genetic causes first (karyotype and microarray).

- Ultrasound for fetal size, structural abnormalities
- Chorionic villous sampling
- If chorionic villous sampling unavailable, consider cell free fetal DNA
- Test products of conception at time of uterine evacuation if above testing is unavailable or not informative

**Only send parental karyotypes if the family history or fetal testing is suggestive of an unbalanced translocation.*

2. If fetal genetic causes are ruled out, evaluate the uterus (saline infusion sonogram +/- 3D imaging).

- Intracavitary lesions (polyps, fibroids, adhesions, septum)
- Fundal contour (assessing further for congenital uterine malformations)
- Myometrium (fibroids, adenomyosis)
- Uterine orientation (retroverted)

3. Assess for laboratory criteria of antiphospholipid antibody syndrome *only if* clinical criteria are met.

- Lupus anticoagulant
- Anticardiolipin IgG and IgM >40
- Beta-2 glycoprotein 1 IgG and IgM >99th percentile

4. If the pregnancy loss occurred after 16 weeks, consider assessment for cervical insufficiency and/or intraamniotic infection in next pregnancy.

**All patients should be counseled about modifiable risk factors, such as smoking, obesity, poorly controlled diabetes, and uncontrolled thyroid dysfunction.*

Hematology in the Adolescent Female Lakshmi V. Srivaths, 2020-08-11 Adolescent females experience a variety of blood disorders that are often unique to this patient population. As they go through puberty they are uniquely poised to encounter various bleeding and thrombotic disorders once they attain menarche start to have menstrual bleeding and require hormonal therapy. This may in turn lead to other medical conditions such as anemia and iron deficiency. Pregnancy encountered by some adolescents can pose hematologic challenges specifically in regards to bleeding and thrombotic disorders. In addition adolescent females are at risk to develop immune mediated hematologic disorders such as immune thrombocytopenia auto immune hemolytic anemia and thrombotic thrombocytopenic purpura as well as vitamin deficiencies due to pernicious anemia. Sickle cell disease thalassemia and bone marrow failure disorders in the adolescent female poses unique challenges that need to be addressed with special care and attention. Knowledge about these various blood disorders in adolescent females is crucial for

the treating physician in order to accurately diagnose and optimally manage these teenagers. Otherwise it can affect their overall health causing hematologic and gynecologic issues, poor quality of life, neurocognitive impairments, and poor psychosocial development, all of which can lead to various complications immediately and into adulthood. This book provides a comprehensive state-of-the-art overview of blood disorders in female adolescents. The text presents new data about bleeding disorders that affect the female adolescent, including bleeding disorders, thromboembolism, thrombophilia, anemia, sickle cell disease, and thalassemia disorders of hemostasis and thrombosis in pregnancy, immune hematology, and bone marrow failure disorders. It reviews our current understanding of these disorders, outlines recent research findings, and spotlights multidisciplinary approaches, evaluation, and treatment modalities to combat these blood disorders. Written by experts in the field, *Hematology in the Adolescent Female* is a valuable resource for clinicians and practitioners who treat and manage female adolescents with blood disorders.
