From its conception in the second century up to the late Renaissance this work determined astronomy as a science. During this time the *Almagest* was not only a work on astronomy; the subject was defined as what is described in the *Almagest*. The cautious emancipation of the late middle ages and the revolutionary creation of the new science in the 16th century are not conceivable without reference to the *Almagest*. This text lifted European astronomy to the high standard of knowledge on which the new science flourished. Before the Ptolemaic models of the orbits of the sun, the moon, and the planets had been refined by Arabic astronomers. They provided the structural elements with which Copernicus and Kepler ushered in the era of modern astronomy. The *Almagest* survived the destruction of its epicyclic representation of the planetary orbits in the conceptual traces left behind in the theories of its successors. The clear separation of the sidereal from the tropical year, the celestial coordinate systems, the concepts of time, the forms of the constellations, and brightness classifications of celestial objects are among many other things still part of the astronomical canon even today.
