## **Magnetogasdynamics And Plasma Dynamics:**

*Magnetogasdynamics and Plasma Dynamics* Shih-I. Pai, 2012-12-06 This book is based on the lecture notes which the author gave in a seminar of the same title in the Institut für theoretische Gasdynamik D V L e V Aachen Germany during the academic year of 1957-1958. The subject matter has been rewritten and expanded after the author's return to the University of Maryland. The purpose of this book is to give a theoretical introduction to plasma dynamics and magnetogasdynamics from the gasdynamic point of view. Attention is given to the basic assumptions and the formulation of the theory of the flow problems of a plasma or ionized gas as well as to the various methods of solving these problems. Since plasma dynamics is still in a developing stage, the author hopes that this book may furnish the readers some basic elements in the theory of plasma dynamics so that they may find it useful for further study and research in this new field. After the introduction in which the scope of plasma dynamics is briefly discussed, the fundamental equations of plasma dynamics from the macroscopic point of view, i.e., the theory of continuum, has been analyzed in detail in chapters I to IV, including many simplified cases such as magnetogasdynamics, magnetohydrodynamics, electromagnetodynamics, radiation magnetogasdynamics, etc. In chapter V, the important parameters and their range of applications have been treated. The parameters are useful in the correlation of experimental results.

Raymond Brun, 2009-02-26 In high-energy gas flows at high velocities and high temperatures, physical and chemical processes such as molecular vibrational excitation, dissociation, ionization, or various reactions take place and deeply influence the structure of the flows. The characteristic times of these processes have the same order of magnitude as aerodynamic characteristic times, so that these reactive media are generally in thermodynamic and chemical non-equilibrium. This book presents a general introductory study of these media. In the first part, their fundamental statistical aspects are described.

starting from their discrete structure and taking into account the interactions between elementary particles transport phenomena relaxation and kinetics as well as their coupling are analysed and illustrated by many examples The second part deals with the macroscopic re entry bodies Finally the experimental aspects of these flows their simulations in shock tubes and shock tunnels are described as well as their application particularly in the aerospace domain This book is intended for students that have acquired a basic knowledge in thermodynamics statistical physics and fluid mechanics It will also be of interest to engineers in research and industry in particular in the aerospace industry and more generally to all researchers trying to simulate and calculate complex reactive flows
