ABCs of z/OS System Programming Volume 13 Paul Rogers,Juha Vainikainen,IBM Redbooks,2012-02-07 A major goal of operating systems is to process jobs while making the best use of system resources Thus one way of viewing operating systems is as resource managers Before job processing operating systems reserve input and output resources for jobs During job processing operating systems manage resources such as processors and storage After job processing operating systems free all resources used by the completed jobs making the resources available to other jobs This process is called resource management There is more to the processing of jobs than the managing of resources needed by the jobs At any instant a number of jobs can be in various stages of preparation processing and post processing activity To use resources efficiently operating systems divide jobs into parts They distribute the parts of jobs to queues to

wait for needed resources Keeping track of where things are and routing work from queue to queue is called workflow management and is a major function of any operating system JES3 considers job priorities device and processor alternatives and installation specified preferences in preparing jobs for processing job output This IBM Redbooks publication describes a JES3 environment that includes the following Single system image Workload balancing Availability Control flexibility Physical planning flexibility **ABCs of z/OS System Programming Volume 11** Paul Rogers,Alvaro Salla,IBM

ARCHIVED: Pooled JVM in CICS Transaction Server V3 Chris Rayns, George Burgess, Scott Clee, Tom Grieve, John Taylor, Yun Peng Ge, Guo Qiang Li, Qian Zhang, Derek Wen, IBM Redbooks, 2015-06-17. NOTE: This book contains information about technologies that have been superseded and it is retained for historical purposes only. IBM CICS Transaction Server CICS TS has supported the deployment of Java applications since the 1990s. In CICS TS V1.3 (1999), IBM introduced the Pooled JVM style of JVM infrastructure within CICS TS. This infrastructure was designed to be similar in nature to that which a CICS application developer for a language such as COBOL would be used to. It brought the benefits of the new Java language to CICS TS without a dramatic change to the way CICS users thought of core concepts such as re-entrancy and isolation. As enterprise usage of Java evolved, it began to make more and more use of multi-threaded environments where isolation was not a desired characteristic. Additionally, technologies such as OSGi (Open Service Gateway Initiative) evolved to overcome some of the original disadvantages of applying Java to an enterprise environment. As such, the limitations of the Pooled JVM approach began to outweigh the benefits. In CICS TS V4.1 (2009), IBM introduced the new JVM server infrastructure in CICS TS as a replacement to the Pooled JVM approach. This JVM server infrastructure provides a much more standard Java environment that makes the writing and porting of Java applications for CICS TS much simpler. In CICS TS V5.1 (2012), support for the old Pooled JVM infrastructure was removed. While there is a relatively simple migration path from Pooled JVM to JVM server applications, should no longer be written to the Pooled JVM infrastructure. There are a number of more recent IBM Redbooks publications covering the replacement JVM server technology, including *IBM CICS and the JVM server: Developing and Deploying Java Applications* (SG24-8038) and *A Software Architect's Guide to New Java Workloads in IBM CICS Transaction Server* (SG24-8225).

IBM HTTP Server on z/OS: Migrating from Domino-powered to Apache-powered Edward McCarthy, IBM Redbooks, 2017-07-13. Users of IBM z/OS for the past several years had a choice of two HTTP Servers that they can use. Now one server became strategic while the other is no longer supported. With z/OS V2.2, IHS powered by Apache supports IPv6 and 64-bit execution and includes security authentication and authorization capabilities that are similar to those capabilities that are provided in IHS powered by IBM Domino. This IBM Redpaper™ publication is aimed at technicians who are responsible for planning and deploying system software. It provides information about the various features that are available in IBM HTTP Server powered by Apache. It also provides guidance about how to upgrade from the old product to the new product.
