**IPv6 Network Administration** Niall Richard Murphy, David Malone, 2005-03-02 What once seemed nearly impossible has turned into reality The number of available Internet addresses is now nearly exhausted due mostly to the explosion of commercial websites and entries from an expanding number of countries This growing shortage has effectively put the Internet community and some of its most brilliant engineers on alert for the last decade Their solution was to create IPv6 a new Internet standard which will ultimately replace the current and antiquated IPv4 As the new backbone of the Internet this new protocol would fix the most difficult problems that the Internet faces today scalability and management And even though IPv6 s implementation has met with some resistance over the past few years all signs are now pointing to its gradual worldwide adoption in the very near future Sooner or later all network administrators will need to understand IPv6 and now is a good time to get started IPv6 Network Administration offers administrators the complete inside info on IPv6 This book reveals the many benefits as well as the potential downsides of this next generation protocol It also shows readers exactly how to set up and administer an IPv6 network A must have for network administrators everywhere IPv6 Network Administration delivers an even handed approach to what will be the most fundamental change to the Internet since its inception Some of the other IPv6 assets that are covered include routing integrated auto configuration quality of services QoS enhanced mobility end to end security IPv6 Network Administration explains what works what doesn t and most of all what s practical when considering upgrading networks from the current protocol to IPv6

For more than 40 years IBM mainframes have supported an extraordinary portion of the world's computing work providing centralized corporate databases and mission critical enterprise wide applications. The IBM System z, the latest generation of the IBM distinguished family of mainframe systems, has come a long way from its IBM System 360 heritage. Likewise its IBM z/OS operating system is far superior to its predecessors providing among many other capabilities world class state of the art support for the TCP/IP Internet protocol suite. TCP/IP is a large and evolving collection of communication protocols managed by the Internet Engineering Task Force (IETF), an open volunteer organization. Because of its openness the TCP/IP protocol suite has become the foundation for the set of technologies that form the basis of the Internet. The convergence of IBM mainframe capabilities with Internet technology connectivity and standards, particularly TCP/IP, is dramatically changing the face of information technology and driving requirements for ever more secure, scalable and highly available mainframe TCP/IP implementations. The IBM z/OS Communications Server TCP/IP Implementation series provides understandable step by step guidance about how to enable the most commonly used and important functions of z/OS Communications Server TCP/IP. In this IBM Redbooks publication we begin with a discussion of Virtual IP Addressing (VIPA), a TCP/IP high availability approach that was introduced by the z/OS Communications Server. We then show how to use VIPA for high availability both with and without a dynamic routing protocol. We also discuss a number of different workload balancing approaches that you can use with the z/OS Communications Server. We also explain the optimized Sysplex Distributor intra sysplex load balancing. This function represents improved multitier application support using optimized local connections together with weight values from extended Workload Manager (WLM) interfaces. Finally we highlight the most important tuning parameters and suggest parameter values that we observed to maximize performance in many client installations. For more specific information about z/OS Communications Server base functions, standard applications and security refer to the other volumes in the series: IBM z/OS V1R11 Communications Server TCP/IP Implementation Volume 1: Base Functions, Connectivity and Routing (SG24-7798); IBM z/OS V1R11 Communications Server TCP/IP Implementation Volume 2: Standard Applications (SG24-7799); IBM z/OS V1R11 Communications Server TCP/IP Implementation Volume 4: Security and Policy Based Networking (SG24-7801). For comprehensive descriptions of the individual parameters for setting up and using the functions described in this book along with step by step checklists and supporting examples refer to the following publications: z/OS Communications Server IP Configuration Guide (SC31-8775); z/OS Communications Server IP Configuration Reference (SC31-8776); z/OS Communications Server IP User's Guide and Commands (SC31-8780). This book does not duplicate the information in those publications. Instead it complements them with practical implementation scenarios that can be useful in your environment. To determine at what level a specific function was introduced refer to z/OS Communications Server New Function Summary (GC31-8771). For complete details we encourage you to review the documents referred to in Related publications on page 303.
