Huijsing, 1997-12-31 1 1 1 Introduction The signal processing and storage capacity of the human brain enables us to become powerful autonomous beings but only if our brains operate in conjunction with at least some of our senses and muscles Using these organs we can interact with our environment learn to adapt and improve important aspects of our life Similarly the signal processing capabilities of modern electronics computers could be combined with electronic sensors and actuators to enable interaction with and adaptation to the non electrical environment This will lead to smarter and more powerful

automated tools and machines To facilitate and stimulate such a development easy to use low cost sensors are needed The combination of electronic interface functions and a sensor in an integrated smart sensor that provides a standard digital and bus compatible output would simplify the connection of sensors to standard electronic signal processors microcontrollers computers etc Currently the calibration procedure required for standardization of the sensor output signal level contributes largely to the production costs of accurate sensors To enable automation of the calibration procedure and hence reduce the sensor fabrication costs a digital calibration junction should be included in the smart sensor

Analog Circuit Design

Rudy J. van de Plassche, Johan Huijsing, Willy M.C. Sansen, 2013-03-09 Today digital signal processing systems use advanced CMOS technologies requiring the analog to digital converter to be implemented in the same digital technology Such an implementation requires special circuit techniques Furthermore the susceptibility of converters to ground bounce or digital noise is an important design criterion In this part different converters and conversion techniques are described that are optimized for receiver applications

Part II Sensor and Actuator Interfaces

interfaces for sensors and actuators shape the gates through which information is acquired from the real world into digital information systems and vice versa The interfaces should include analog signal conditioning analog to digital conversion digital bus interfaces and data acquisition networks To simplify the use of data acquisition systems additional features should be incorporated like self test and calibration
