Magnetic Electron Lenses P.W. Hawkes, 2013-11-11 No single volume has been entirely devoted to the properties of magnetic lenses so far as I am aware although of course all the numerous textbooks on electron optics devote space to them The absence of such a volume bringing together information about the theory and practical design of these lenses is surprising for their introduction some fifty years ago has created an entirely new family of commercial instruments ranging from the now traditional transmission electron microscope through the reflection and transmission scanning microscopes to columns for micromachining and microlithography not to mention the host of experimental devices not available commercially It therefore seemed useful to prepare an account of the various aspects of magnetic lens studies These divide naturally into the five chapters of this book the theoretical background in which the optical behaviour is described and formulae given for the various aberration coefficients numerical methods for calculating the field distribution and trajectory tracing extensive discussion of the paraxial optical properties and aberration coefficients of practical lenses illustrated with curves from which numerical information can be obtained a complementary account of the practical engineering aspects of lens design including permanent magnet lenses and the various types of superconducting lenses and finally an up to date survey of several kinds of highly unconventional magnetic lens which may well change the appearance of future electron optical instruments very considerably after they cease to be unconventional The Encyclopedia of Physics Robert Besancon, 2013-11-11 **Application of Monte Carlo Techniques to Optimization of High-energy Beam Transport in a Stochastic Environment**

Russell V. Parrish, James E. Dieudonne, Tassos A. Filippas, 1971 An algorithm employing a modified sequential random perturbation or creeping random search was applied to the problem of optimizing the parameters of a high energy beam transport system The stochastic solution of the mathematical model for first order magnetic field expansion allows the inclusion of state variable constraints and the inclusion of parameter constraints allowed

by the method of algorithm application eliminates the possibility of infeasible solutions The mathematical model and the algorithm were programmed for a real time simulation facility thus two important features are provided to the beam designer

- 1 a strong degree of man machine communication even to the extent of bypassing the algorithm and applying analog matching techniques and
- 2 extensive graphics for displaying information concerning both algorithm operation and transport system behavior

Chromatic aberration was also included in the mathematical model and in the optimization process Results presented show this method as yielding better solutions in terms of resolutions to the particular problem than those of a standard analog program as well as demonstrating flexibility in terms of elements constraints and chromatic aberration allowed by user interaction with both the algorithm and the stochastic model Example of slit usage and a limited comparison of predicted results and actual results obtained with a 600 MeV cyclotron are given
