## **Quality Assurance In Adhesive Technology:**

Quality Assurance in Adhesive Technology A W Espie, J H Rogerson, 1998-03-24 Quality Assurance in Adhesive Technology presents a unique collaboration between the Center for Adhesive Technology of TWI Cambridge Cranfield University UK the Department of Trade and Industry and UK industrial participants The project identified that the highlighting of design and production issues during very early design stages enabled potential areas of difficulty to be recognized and avoided To achieve this a quality assurance model was developed to analyze the issues needing to be addressed well before a component reaches the production stage In addition to the book Quality Assurance associated software features flexible menu selection which will help users to customize the model to any particular manufacturing requirement and achieve higher levels of reliability in their adhesive bonding processes

**Quality Assurance in Adhesive Technology** A W Espie, J H Rogerson, K Ebtehaj, 1998-01-01 This special report with user friendly software has been produced following a collaboration between the Centre for Adhesives technology at TWI Cranfield University and the DTI The three year project identified that highlighting design and production issue during very early stages of design enabled potential problem areas to be recognised and avoided The team have therefore developed a generic quality assurance model to pinpoint the issues needing to be addressed well before a component reaches the production stage The software is extremely user friendly and comes with a flexible menu selection which enables the model to be customised to particular manufacturing requirements It will be widely welcomed by designers and engineers involved with any products using adhesives or sealants

**Nondestructive Evaluation of Adhesive Bonds Using 20 MHz and 25 kHz Ultrasonic Frequencies on Metal and Polymer Assemblies** Gilbert B. Chapman II, 2014-07-17 Demands for improvements in aerospace and automotive energy efficiency performance corrosion resistance body stiffness and style have increased the use of adhesive bonds to help meet those demands by providing joining technology that accommodates a wider variety of materials and design options However the history of adhesive bond performance clearly indicates the need for a robust method of assuring the existence of the required consistent level of adhesive bond integrity in every bonded region The Quality Assurance of Adhesive Bonds by Ultrasonic Nondestructive Testing technology put forth in this book meets that need by describing two new complementary ultrasonic techniques for the evaluation of these bonds and thus provide improvements over previous methods The development of a 20 MHz pulse echo method for nondestructive evaluation of adhesive bonds will accomplish the assessment of bond joints with adhesive as thin as 0.1 mm This new method advances the state of the art by providing a high resolution phase sensitive procedure that identifies the bond state at each interface of the adhesive with the substrate s by the acquisition and analysis of acoustic echoes reflected from interfaces between layers with large acoustic impedance mismatch Because interface echo amplitudes are marginal when the acoustic impedance of the substrate is close to that of the adhesive a 25 kHz Lamb wave technique was developed to be employed in such cases albeit with reduced resolution Modeling the ultrasonic echoes and Lamb wave signals was accomplished using mathematical expressions developed from the physics of acoustic transmission attenuation and reflection in layered media The models were validated by experimental results from a variety of bond joint materials geometries and conditions thereby confirming the validity of the methodology used for extracting interpretations from the phase sensitive indications as well as identifying the range and limits of applications Results from the application of both methodologies to laboratory specimens and to samples from production operations are reported herein and show that bond joint integrity can be evaluated effectively over the range of materials and geometries addressed
