Low Temperature Plasma Physics R. Hippler, 2001-06-18 Low temperature plasma physics is a very active area of research located on the boundaries between physics chemistry and materials science Recent technological developments e g in plasma etching or plasma deposition have led to a revived interest in plasma physics and technology This volume describes in detail fundamentals and applications of low temperature plasma physics including newest achievements The authors of this volume are top scientists from the USA and Europe who present most recent successes in our understanding of how plasmas behave and put a strong focus on the links between theory and experiment or technological process

Physics and Technology of Low-temperature Plasmas S. V. Dresvin, Aleksandr Vasil'evich Donskoĭ, 1977

Advances in Low Temperature Rf Plasmas Toshiaki Makabe, 2002 Low temperature plasmas have had a very broad range of applications ever since their discovery However recent developments in the dextrous handling of dry etching non equilibrium plasma have attracted a great common interest that has driving force behind the major developments in diagnostic theoretical and numerical techniques since the 1980s A greater fundamental understanding of the kinetics of radio frequency rf plasmas and their interaction with surfaces in regard to the process of large scale integrated circuits has been achieved through the cooperation between academia and industry At the same time new applications have become possible and the basic understanding of low temperature rf plasmas has diffused to other areas of plasma physics in the special issue of *Applied Surface Science* which is published in memory of the International Workshop on Basis for Low Temperature Plasma

Applications at Hakone in Japan on July 24-25 of 2001. The basic goal in the selection of topics was to cover the range of issues that represent the building blocks of the complex vertically integrated plasma simulation schemes including surface processes. The text also shows examples of integrated codes and how they are implemented in the development of new strategies of plasma processing. Such codes may be used both in modern experiments and in the computer aided design and control of the plasma devices of the next generation. These are based on the transport theory of electrons, ions and neutrals as well as on numerical modellings and on the available collision and transport data describing gas and surface phases density plasmas. All the chapters present a relatively complete review of the developments in these fields since the 1980s as well as a review of their status of development in 2002 and there is a blend of research reviews from both academia and industry.

Kinetics of Nonequilibrium Low-Temperature Plasmas Leon Mikhaïlovich Biberman, Vladimir Sergeevich Vorob'ev, I.T. Yakubov, 1987-09-30. The first research on plasma was done in connection with the study of electrical discharges in gases. The focus of attention for physicists was the partially ionized plasma the kinetics of which is governed by various collisional and radiative processes. The choice of this area of research was motivated largely by the practical problems of that time: the creation of gas discharge light sources, rectifiers and inverters. Since the early 1950s interest in plasma physics has risen sharply, particularly in the study of the completely ionized plasma with its various collective phenomena, instabilities and the interesting and sometimes unexpected effects attending the propagation of electromagnetic waves in such a plasma and the action on it of external electric and magnetic fields. Interest in hot plasmas has been stimulated not only by the diverse and novel physical phenomena but also by the problems arising in connection with controlled nuclear fusion. The advent in the early 1960s of new technical fields such as gas discharge lasers, magnetohydrodynamic generators, thermoemission converters, plasma chemistry, plasma propulsion devices, various methods in plasma technology etc. has led to increased interest in weakly ionized low temperature plasmas. This is particularly true of nonequilibrium plasmas which are characterized by an extraordinary diversity of states and properties.
