

Elements of MOS ICs

MOS integrated circuits are based on insulated-gate field-effect transistors.

MOS devices and associated integrated circuits are fabricated in silicon using similar processing techniques to those used for bipolar circuits, but, because of the much simpler structure of the MOSFET, fewer processing stages are required.

There are four types of FETs:

- **transistors with n or p channel and**
- **transistors, containing built channel, and transistors with induced channel.**

Electrons are majority carriers in a n channel. Their mobility is higher. For this reason properties of nMOSFETs are better.

The structure and processing of a MOSFET with induces channel is less complicate.

MOSFETs with induced channels are the main elements of MOS ICs.
