Rocas Alijos:

Rocas Alijos Robert W. Schmieder, 2013-03-09 Rocas Alijos lies 180 nautical miles west of Baja California. It comprises several exposed rocks that surmount a large oceanic volcano rising from the ocean floor well off the continental shelf. It is located at the transition zone between two major biologic provinces at a latitude where the Pacific Current turns westward to form the north Pacific trans-oceanic current. In spite of its obvious importance for biogeographical studies, the remoteness of Rocas Alijos and its small size thwarted any major scientific work until very recently, and the topography, biota, and oceanographic conditions of the site remained largely unknown. During 1990 and again in 1993 Cordell Expeditions, a nonprofit research organization based in Walnut Creek, California, undertook expeditions to describe the site. A scientific team of 30 was on site 31 October–7 November 1990, and a scientific team of 12 was on site 10–15 February 1993. Since most of the Rocas Alijos site is subtidal, much of the examination and specimen collection was done by scuba, although several remote sampling techniques were also used. The exposed rocks were sampled by climbers, and megafauna were observed from shipboard.

Monographiae Biologicae Robert W. Schmieder, 1957 *Reef Fishes of the Sea of Cortez* Donald A. Thomson, Lloyd T. Findley, Alex N. Kerstitch, 2010-07-05 First published in 1979, this guide has become the standard resource for scientists, divers, and spearfishers interested in the fishes of the tropical Pacific Coast. The authors have revised and updated this edition to include the most current taxonomic information, additional species descriptions, and new illustrations.

The Maritime Political Boundaries of the World Victor Prescott, Clive Schofield, 2005-01-01 This book addresses the often vexed question of national maritime claims and the delimitation of international maritime boundaries. The number of undelimited international maritime boundaries is much larger than the number of agreed lines. The two boundaries that define the marine domain of coastal states are examined. First, the baselines along the coast may consist of low water lines or straight lines, or a combination of both. When straight lines are used, they define the seaward limit of the state's internal waters. Second, the outer limits of claims to territorial seas, contiguous zones, and exclusive economic zones are measured from the baselines. All states will have to delimit at least one international boundary with a neighbouring state, whether adjacent or opposite. In confined seas, no state can claim the full entitlement and must negotiate international boundaries with all neighbours. Many states bordering oceans can claim the full entitlement seawards, although they will need to delimit national boundaries with adjacent neighbours.
