Freshwater Fisheries Ecology John F. Craig, 2016-01-12 Inland fisheries are vital for the livelihoods and food resources of humans worldwide but their importance is underestimated probably because large numbers of small local operators are involved Freshwater Fisheries Ecology defines what we have globally what we are going to lose and mitigate for and what given the right tools we can save To estimate potential production the dynamics of freshwater ecosystems rivers lakes and estuaries need to be understood These dynamics are diverse as are the earth's freshwater fisheries resources from boreal to tropical regions and these influence how fisheries are both utilized and abused Three main types of fisheries are illustrated within the book artisanal commercial and recreational and the tools which have evolved for fisheries governance and management including assessment methods are described The book also covers in detail fisheries development providing information on improving fisheries through environmental and habitat evaluation enhancement and rehabilitation aquaculture genetically modified fishes and sustainability The book thoroughly reviews the negative impacts on fisheries including excessive harvesting climate change toxicology impoundments barriers and abstractions non native species and eutrophication Finally key areas of future research are outlined Freshwater Fisheries Ecology is truly a landmark publication containing contributions from over 100 leading experts and supported by the Fisheries Society of the British Isles The global approach makes this book essential reading for fish biologists fisheries scientists and ecologists and upper level students in these disciplines Libraries in all universities and research establishments where biological and fisheries sciences are studied and taught should have multiple copies of this hugely valuable resource About the Editor John Craig is Editor in Chief of the Journal of Fish Biology and has an enormous range of expertise and a wealth of knowledge of freshwater fishes and their ecology having studied them around the globe including in Asia North America Africa the Middle East and Europe His particular interests have been in population dynamics and life history strategies He is a Fellow of the Linnean Society of London and the Royal Society of

Conservation of Endangered Freshwater Fish in Europe Arthur Kirchhofer, Daniel Müller, 2012-12-06 Two events have recently improved the prospects of protecting fish and their environment in Switzerland the acceptance of a new Federal Water Protection Law in the plebiscite of May 17th 1992 and the new Federal Legislation on Fisheries in force since January 1st 1994 With this legal framework the possibilities for protection of nature and landscape have now considerably improved in Switzerland The most important aims of the Federal Law on Water Protection are to safeguard the natural habitats of the native flora and fauna and water as the habitat of aquatic organisms This includes not only the preservation or restoration of water quality in lakes and rivers but also in rivers used for hydroelectricity irrigation or as industrial or other water supplies the maintenance of sufficient water to fulfill the minimal requirements for fish However good quality water in sufficient quantities alone is not enough to guarantee the survival of fish Intact fish habitats comprise various physical structures including plenty of hiding places hunting grounds reproduction and nursery areas within suitable distances from each other This third aspect of conservation and restoration of aquatic habitats is a central point in the new Federal Law on Fisheries Whereas the former versions of this law were more concerned with fishery

regulations the recent legislation defines new areas of responsibility for the federal and the cantonal governments **A review of the inland fisheries of the People's Republic of China and the strengthening of capacity in the collection and analysis of inland fisheries statistics** Food and Agriculture Organization of the United Nations, 2024-01-03

China's surface waters cover 20.6 million ha. The aquatic living resources in these waters not only sustain wild natural fishery production but also support fish production based on stock enhancement and aquaculture. Most inland capture fisheries are concentrated in the major rivers and lakes, whereas reservoirs are dominated by enhanced fisheries. In 2020, the national freshwater fishing output was 1.46 million tonnes, which was a decrease of 20.84 percent from the previous year. Since 2005, the output value of freshwater capture fishing and aquatic products in China has exceeded CNY 20 billion, reaching a peak of CNY 46.577 billion in 2018. With increasing economic development, the role of inland capture fisheries in the social economy has changed. Since the 1990s, there has been a gradual increase in aquaculture, and since 2010, a gradual decrease in inland capture fishery production. With the issuance of various fishing ban policies and the strengthening of enforcement actions, especially the implementation of the 10-year fishing ban on the Yangtze River and the fishing ban on major lakes, inland capture fisheries production has dropped sharply since 2016, and this development is expected to continue due to the increased awareness of the need for ecological protection in large waterbodies, the implementation of the fishing ban policy, and the strengthening of law enforcement. However, even though aquaculture production has massively increased and provides the bulk of freshwater fish supply, high-quality aquatic products from natural waters are still highly sought after by consumers.
