Fundamentals of Air Pollution Daniel A. Vallero, 2014-07-26

Fundamentals of Air Pollution is an important and widely used textbook in the environmental science and engineering community This thoroughly revised fifth edition of Fundamentals of Air Pollution has been updated throughout and remains the most complete text available offering a stronger systems perspective and more coverage of international issues relating to air pollution Sections on pollution control have been reorganized and updated to demonstrate the move from regulation and control approaches to green and sustainable engineering approaches The fifth edition maintains a strong interdisciplinary approach to the study of air pollution covering such topics as chemistry physics meteorology engineering toxicology policy and regulation New material includes near road air pollution new risk assessment approaches indoor air quality the impact of biofuels and fuel additives mercury emissions forecasting techniques and the most recent results from the National Air Toxics Assessment Stronger systems approach emphasizing the impact of air pollution on ecosystems and human health Risks measures models and control of air pollution are discussed at scale starting at the individual niche level and expanding to planetary global scale Increased emphasis on international issues including coverage of European initiatives and discussions of the impact of emerging economies like India and China Updated references standards and methods throughout the book make this the most current air pollution text reference on the market All new end of chapter problems enhance its usefulness as a course text

Ice Core Studies of Global Biogeochemical Cycles Robert J.

Delmas,2013-06-29 The analysis of polar ice cores has proven to be very instructive about past environmental conditions on the time scale of several climatic cycles and recent drilling operations have provided information of great value for global change issues The book presents the most recent data extracted from Greenland ice cores and surface experiments and compares them with former Antarctic results It contains background articles original contributions and group reports of interest to scientists climatologists atmospheric chemists and glaciologists involved in global change research

Fundamentals of Air Pollution Daniel Vallero,2007-10-01 Fundamentals of Air Pollution is an important and widely used textbook in the environmental science and engineering community Written shortly after the passage of the seminal Clean Air Act Amendments of 1990 the third edition was quite timely Surprisingly the text has remained relevant for university professors engineers scientists policy makers and students up to recent years However in light of the transition in the last five years from predominantly technology based standards maximum achievable control technologies or MACTs to risk based regulations and air quality standards the text must be updated significantly The fourth edition will be updated to include numerous MACTs which were not foreseen during the writing of the third edition such as secondary lead Pb smelting petroleum refining aerospace manufacturing marine vessel loading ship building printing and publishing elastomer production offsite waste operations and polyethylene terephthalate polymer and styrene based thermoplastic polymers production Focuses on the process of risk assessment management and communication the key to the study of air pollution Provides the latest information on the technological breakthroughs in environmental engineering since last edition Updated information on computational and diagnostic and operational tools that have emerged in recent years **Annual Report to the President and the Congress of the United States** United States. Precipitation Scavenging And Atmosphere-Surface Exchange Stephen Schwartz,W.G.N. Slinn,1992-06-01 This three volume set contains selected papers arising from a conference held in 1991 on precipitation and air pollution The first volume addresses the precipitation scavenging process the second deals with atmosphere surface exchange processes and the third covers air pollution and deposition **Chemical Speciation in the Environment** A. M. Ure,C. M.

Davidson,2008-04-15 Considerable recent research has focused on the topic of chemical speciation in the environment It is increasingly realised that the distribution mobility and biological availability of chemical elements depend not simply on their concentrations but critically on the forms in which they occur in natural systems Continuing developments in analytical chemistry have made speciation practicable even where analytes are present at trace levels as is often the case in natural samples In the second edition of this book the expertise of scientists involved in chemical speciation in various fields have been brought together to provide an overview of the current status of speciation science and indicate how the field may develop in the future **Interactions of C, N, P and S Biogeochemical Cycles and Global Change** Roland Wollast,Fred T. Mackenzie,Lei Chou,2013-06-29 This book is a natural extension of the SCOPE Scientific Committee of Problems on the

Environment volumes on the carbon C nitrogen N phosphorus P and sulfur S biogeochemical cycles and their interactions Likens 1981 Bolin and Cook 1983 Substantial progress in the knowledge of these cycles has been made since publication of those volumes In particular the nature and extent of biological and inorganic interactions between these cycles have been identified positive and negative feedbacks recognized and the relationship between the cycles and global environmental change preliminarily elucidated In March 1991 a NATO Advanced Research Workshop was held for one week in Melreux Belgium to reexamine the biogeochemical cycles of C N P and S on a variety of time and space scales from a holistic point of view This book is the result of that workshop The biogeochemical cycles of C N P and S are intimately tied to each other through biological productivity and subsequently to problems of global environmental change These problems may be the most challenging facing humanity in the 21 st century In the broadest sense global change encompasses both changes to the status of the large globally connected atmospheric oceanic and terrestrial environments e g tropospheric temperature increase and change occurring as the result of nearly simultaneous local changes in many regions of the world e g eutrophication

Air Pollution Modeling and Its Application VII Han Van Dop,2013-11-11 Air pollution remains a major environmental issue despite many years of study and much legislative control In recent times pollution on a global scale has become of particular concern The gradually changing concentration of trace gases in the global troposphere due to man's activity is becoming a matter of serious concern No scientist would dare to predict in detail the consequences of this gradual change due to its immense complexity involving social and economic factors and near countless chemical and physical cycles in our biosphere In this chain of processes the transport of pollution is an important factor but only a factor Therefore I would like to emphasize that the modelling of atmospheric transport is becoming more and more an activity which fits into larger frameworks and can no longer be exercised as a single step which bridges the gap between emissions and policy measures This is also reflected in the topics and papers which were presented at this conference The topics were emission inventories for and source treatment in air pollution dispersion models modelling of accidental releases regional and global scale dispersion modelling including boundary layer free troposphere exchange processes and subgrid scale parameterisations model verification and policy implications new developments in dispersion modelling and theory 56 papers were presented in these sections While many posters were discussed in a special session

Global Atmospheric Chemical Change C.N. Hewitt,W.T. Sturges,2013-11-11 Air pollution has historically been viewed as a local or regional scale problem with attention focused on acute episodes such as the sulphur dioxide and smoke smogs of London in the 1950s and 1960s and the photochemical smogs of southern California first recognized by Haagen Smit in the early 1950s In recent years however it has become apparent that human activity has and still is changing the chemical composition of the atmosphere on a global scale The composition of the atmosphere has seen enormous changes due to natural processes

since the formation of the planet Data obtained from air bubbles trapped in polar ice are beginning to reveal information about these changes over the last tens of thousands of years and geochemical models of the evolution of the Earth give us insights into the changes over much longer periods of time Perhaps the crucial differences between these natural changes and those now being induced by man are their relative rates of change The magnitude of present day fluxes of some compounds released as air pollutants is in some cases much larger than those arising naturally In other cases for example carbon dioxide the anthropogenic emission rates are small compared with that of the natural cycle but the kinetics of the system are such that the steady state concentrations of the compounds in the atmosphere are now being perturbed

Emerging contaminants ECs are predominantly unregulated anthropogenic chemicals that occur in air soil water food and plant animal tissues in trace concentrations ECs are persistent in the environment capable of perturbing the physiology of target receptors and therefore are increasingly regarded as a subject of concern This volume aims to enhance understanding of emerging contaminants effects on plants and the environment and to highlight and address the need of sustainable and eco friendly approaches in mitigating and remediating the effects of ECs The book comprises chapters from diverse areas dealing with biotechnology microbial technology nanotechnology molecular biology remediation and more This volume will be useful to remediation practitioners researchers regulators and graduate students
