

The diagram illustrates the structural differences between a healthy lung and a diseased lung. On the left, a 'Healthy Lung' is shown with a clear, pinkish-red color and a network of branching bronchi and blood vessels. On the right, a 'Diseased Lung' is shown with a more inflamed, reddish-pink color and a significantly altered internal structure. Two circular insets provide magnified views of the diseased lung's internal structure. The top inset, labeled 'Emphysema', shows enlarged, irregular alveoli (air sacs) with thin, fragmented walls. The bottom inset, labeled 'Chronic bronchitis', shows a bronchus with a thick, inflamed wall and a narrowed lumen. The diseased lung also shows a more prominent, inflamed trachea and a more congested network of blood vessels.

In normal healthy breathing, air moves in and out of the lungs to meet the demands of the body; this is impaired in COPD. Patients with COPD may develop a chronic cough and shortness of breath. Symptoms may be minimal early in the disease, but tend to worsen with time.

Background: A cognitive bias known as the sunk cost fallacy (the Sunk Cost Fallacy, SCF) is a common cognitive error in which people continue to invest resources in a project or decision, even when the costs outweigh the benefits. This is often due to the fact that people have already invested resources in the project and are reluctant to accept that those resources were wasted. The SCF is a well-documented phenomenon in psychology and economics, and it has been shown to lead to poor decision-making in a variety of contexts, including business, politics, and personal life.
