Kaisler, 2019-06-04 Second Generation Mainframes The IBM 7000 Series describes IBM's second generation of mainframe computers which introduced new technology, new peripherals and advanced software. These systems were continuations of the instruction sets of the IBM 700 series with significant enhancements but supported upwards compatibility that preserved customers' investment in the earlier series. The use of magnetic cores, fast magnetic tapes and disks and transistors yielded computation speeds that opened new domains for computation. Programming languages continued to be developed and enhanced and new ones were developed for specific domains such as SNOBOL, COBOL and Macro Assemblers. Robust subroutine libraries for mathematical applications appeared. New operating systems provided many capabilities to programmers for data management and file systems, limited multiprocessing, timesharing, programming language support and better error handling and control of peripherals. Early concepts in persistent file systems on magnetic disks were developed that changed the nature of job processing. The IBM 7000 series led the way in many innovative concepts that helped to establish IBM as the foremost manufacturer of computer systems. However, the diversity of the models put significant strain on IBM's financial resources and development teams, which ultimately led to IBM's development of the System 360 family of machines.      **Datamation** , 1983      *Time-sharing in Commercial Banks* Federal Deposit Insurance Corporation, 1972      **Computerworld** , 1986-07-21 For more than 40 years Computerworld has been the leading source of technology news and information for IT influencers worldwide.
