Committee on Appropriations, 2007 **Technical Evaluation of the NASA Model for Cancer Risk to Astronauts Due to Space Radiation** National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Committee for Evaluation of Space Radiation Cancer Risk Model, 2012-04-19 NASA's current missions to the International Space Station ISS and potential future exploration missions involving extended stays by astronauts on the lunar surface as well as the possibility of near Earth object NEO or Mars missions present challenges in protecting astronauts from radiation risks These risks arise from a number of sources including solar particle events SPEs galactic cosmic rays GCRs secondary radiation from surface impacts and even the nuclear isotope power sources transported with the astronauts The serious early and late radiation health effects potentially posed by these exposures are equally varied ranging from early

signs of radiation sickness to cancer induction Other possible effects include central nervous system damage cataracts cardiovascular damage heritable effects impaired wound healing and infertility Recent research much of which has been sponsored by NASA has focused on understanding and quantifying the radiation health risks posed by space radiation environments Although many aspects of the space radiation environments are now relatively well characterized important uncertainties still exist regarding biological effects and thus regarding the level and types of risks faced by astronauts This report presents an evaluation of NASA's proposed space radiation cancer risk assessment model which is described in the 2011 NASA report Space Radiation Cancer Risk Projections and Uncertainties 2010 The evaluation in Technical Evaluation of the NASA Model for Cancer Risk to Astronauts Due to Space Radiation considers the model components input data for the radiation types estimated doses and epidemiology and the associated uncertainties This report also identifies gaps in NASA's current research strategy for reducing the uncertainties in cancer induction risks

Achieving Science with CubeSats
National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Space Studies Board, Committee on Achieving Science Goals with CubeSats, 2016-10-06

Space based observations have transformed our understanding of Earth its environment the solar system and the universe at large During past decades driven by increasingly advanced science questions space observatories have become more sophisticated and more complex with costs often growing to billions of dollars Although these kinds of ever more sophisticated missions will continue into the future small satellites ranging in mass between 500 kg to 0.1 kg are gaining momentum as an additional means to address targeted science questions in a rapid and possibly more affordable manner Within the category of small satellites CubeSats have emerged as a space platform defined in terms of 10 cm x 10 cm x 10 cm sized cubic units of approximately 1.3 kg each called U.S. Historically CubeSats were developed as training projects to expose students to the challenges of real world engineering practices and system design Yet their use has rapidly spread within academia industry and government agencies both nationally and internationally In particular CubeSats have caught the attention of parts of the U.S. space science community which sees this platform despite its inherent constraints as a way to affordably access space and perform unique measurements of scientific value The first science results from such CubeSats have only recently become available however questions remain regarding the scientific potential and technological promise of CubeSats in the future

Achieving Science with CubeSats reviews the current state of the scientific potential and technological promise of CubeSats This report focuses on the platform's promise to obtain high priority science data as defined in recent decadal surveys in astronomy and astrophysics Earth science and applications from space planetary science and solar and space physics heliophysics the science priorities identified in the 2014 NASA Science Plan and the potential for CubeSats to advance biology and microgravity research It provides a list of sample science goals for CubeSats many of which address targeted science often in coordination with other spacecraft or use sacrificial or high risk orbits that lead to the demise of the satellite after critical

data have been collected Other goals relate to the use of CubeSats as constellations or swarms deploying tens to hundreds of CubeSats that function as one distributed array of measurements

Recapturing a Future for Space Exploration

National Research Council, Division on Engineering and Physical Sciences, Aeronautics and Space Engineering Board, Space Studies Board, Committee for the Decadal Survey on Biological and Physical Sciences in Space, 2012-01-30 More than four decades have passed since a human first set foot on the Moon Great strides have been made in our understanding of what is required to support an enduring human presence in space as evidenced by progressively more advanced orbiting human outposts culminating in the current International Space Station ISS However of the more than 500 humans who have so far ventured into space most have gone only as far as near Earth orbit and none have traveled beyond the orbit of the Moon Achieving humans further progress into the solar system had proved far more difficult than imagined in the heady days of the Apollo missions but the potential rewards remain substantial During its more than 50 year history NASA's success in human space exploration has depended on the agency's ability to effectively address a wide range of biomedical engineering physical science and related obstacles an achievement made possible by NASA's strong and productive commitments to life and physical sciences research for human space exploration and by its use of human space exploration infrastructures for scientific discovery The Committee for the Decadal Survey of Biological and Physical Sciences acknowledges the many achievements of NASA which are all the more remarkable given budgetary challenges and changing directions within the agency In the past decade however a consequence of those challenges has been a life and physical sciences research program that was dramatically reduced in both scale and scope with the result that the agency is poorly positioned to take full advantage of the scientific opportunities offered by the now fully equipped and staffed ISS laboratory or to effectively pursue the scientific research needed to support the development of advanced human exploration capabilities Although its review has left it deeply concerned about the current state of NASA's life and physical sciences research the Committee for the Decadal Survey on Biological and Physical Sciences in Space is nevertheless convinced that a focused science and engineering program can achieve successes that will bring the space community the U S public and policymakers to an understanding that we are ready for the next significant phase of human space exploration The goal of this report is to lay out steps and develop a forward looking portfolio of research that will provide the basis for recapturing the excitement and value of human spaceflight thereby enabling the U S space program to deliver on new exploration initiatives that serve the nation excite the public and place the United States again at the forefront of space exploration for the global good
