New Directions In Affective Disorders:

New Directions in Affective Disorders Bernard Lerer, Samuel Gershon, 2012-12-06 This book is presented as a 1989 update on the task set by Robert Burton in his *Anatomy of Melancholy* published in 1621. Burton's treatise addressed questions regarding depression which are still highly relevant today. What is it with all the kinds, causes, symptoms, prognostics, and several cures of it? These remain the core issues in affective disorders notwithstanding the remarkable progress that has been made in addressing them. *New Directions in Affective Disorders* sets out to provide an overview of what has been achieved with particular emphasis on developing trends and novel initiatives in both fundamental research and treatment. The overriding objective of the book is to integrate significant contributions from basic and clinical science into a comprehensive format which will be of value to both clinicians and researchers. Intensive interest in affective illness is an inevitable consequence of the frequency with which these disorders occur. Depression is the most common psychiatric condition affecting as many as 50% of people in Western countries at some time in their lives. National Institute of Mental Health Statistics estimate that 15% of adults between 18 and 74 years of age may be suffering from serious depressive disorders in any given year. Depression is a serious condition with a high mortality. A suicide rate of approximately 20,000 deaths per year as a result of this illness is almost certainly a conservative estimate.

Brain disorders neurological psychiatric and developmental now affect at least 250 million people in the developing world and this number is expected to rise as life expectancy increases. Yet public and private health systems in developing countries have paid relatively little attention to brain disorders. The negative attitudes, prejudice, and stigma that often surround many of these disorders have contributed to this neglect. Lacking proper diagnosis and treatment, millions of individual lives are lost to disability and death. Such conditions exact both personal and economic costs on families, communities, and nations. The report describes the causes and risk factors associated with brain disorders. It focuses on six representative brain disorders that are prevalent in developing countries: developmental disabilities, epilepsy, schizophrenia, bipolar disorder, depression, and stroke. The report makes detailed recommendations of ways to reduce the toll exacted by these six disorders. In broader strokes, the report also proposes six major strategies toward reducing the overall burden of brain disorders in the developing world.
