Software for Computer Control is a collection of papers and lectures presented at the Second IFAC IFIP Symposium on Software for Computer Control held in Prague Czechoslovakia in June 1979. The symposium is organized with the hope of making vital contributions to the development of the computer sciences. The text focuses on the design and programming of process control systems used in various industrial processes and experiments. Topics covered include communication control in computer networks, program generators for process control applications, methods for the design of control software, presentations on software for microprocessors, real time languages, algorithms for computer control, and applications of computer control in sciences. Computer scientists, systems analysts, programmers, and students of computer science will benefit from this book.

Types and Programming Languages Benjamin C. Pierce, 2002-01-04. A comprehensive introduction to type systems and programming languages. A type system is a syntactic method for automatically checking the absence of certain erroneous behaviors by classifying program phrases according to the kinds of values they compute. The study of type systems and of programming languages from a type theoretic perspective has important applications in software engineering, language design, high performance compilers, and security. This text provides a comprehensive introduction both to type systems in computer science and to the basic theory of programming languages. The approach is pragmatic and operational; each new concept is motivated by programming examples, and the more theoretical sections are driven by the needs of implementations. Each chapter is accompanied by numerous exercises and solutions, as well as a running implementation available via the Web. Dependencies between chapters are explicitly identified, allowing readers to choose a variety of paths through the material. The core topics include the untyped lambda calculus, simple type systems, type reconstruction, universal and existential polymorphism, subtyping, bounded quantification, recursive types, kinds, and type operators. Extended case studies develop a variety of approaches to modeling the features of object oriented languages.

Programming Methodology David Gries, 2012-12-06. This volume is being published for two reasons. The first is to present a collection of previously published articles on the subject of programming methodology that have helped define the field and give it direction. It is hoped that the scientist in the field will find the volume useful as a reference, while the scientist in neighboring fields will find it useful in seriously acquainting himself with important ideas in programming methodology. The advanced student can also study it either in a course or by himself in order to learn

significant material that may not appear in texts for some time The second reason for this volume is to make public the nature and work on programming methodology of IFIP Working Group 2.3 hereafter called WG2.3 IFIP stands for International Federation for Information Processing WG2.3 is one of many IFIP Working Groups that have been established to provide international forums for discussion of ideas in various areas Generally these groups publish proceedings of some of their meetings and occasionally they sponsor a larger conference that persons outside a group can attend WG2.3 has been something of a maverick in this respect From the beginning the group has shunned paperwork reports meetings and the like This has meant less publicity for IFIP and WG2.3 but on the other hand it has meant that meetings could be devoted almost wholly to scientific discussions

Algol-like Languages Peter O'Hearn, Robert Tennent, 2013-03-12 In recent years there has been a remarkable convergence of interest in programming languages based on ALGOL 60 Researchers interested in the theory of procedural and object oriented languages discovered that ALGOL 60 shows how to add procedures and object classes to simple imperative languages in a general and clean way

And on the other hand researchers interested in purely functional languages discovered that ALGOL 60 shows how to add imperative mechanisms to functional languages in a way that does not compromise their desirable properties Unfortunately many of the key works in this field have been rather hard to obtain The primary purpose of this collection is to make the most significant material on ALGOL like languages conveniently available to graduate students and researchers Contents

Theoretical Aspects of Object-oriented Programming Carl A. Gunter, John C. Mitchell, 1994 Although the theory of object oriented programming languages is far from complete this book brings together the most important contributions to its development to date focusing in particular on how advances in type systems and semantic models can contribute to new language designs The fifteen chapters are divided into five parts Objects and Subtypes Type Inference Coherence Record Calculi and Inheritance The chapters are organized approximately in order of increasing complexity of the programming language constructs they consider beginning with variations on Pascal and Algol like languages developing the theory of illustrative record object models and concluding with research directions for building a more comprehensive theory of object oriented programming languages Part I discusses the similarities and differences between objects and algebraic style abstract data types and the fundamental concept of a subtype Parts II IV are concerned with the record model of object oriented languages Specifically these chapters discuss static and dynamic semantics of languages with simple object models that include a type or class hierarchy but do not explicitly provide what is often called dynamic binding Part V considers extensions and modifications to record object models moving closer to the full complexity of practical object oriented languages Carl A Gunter is Professor in the Department of Computer and Information Science at the University of Pennsylvania John C Mitchell is Professor in the Department of Computer Science at Stanford University

ECOOP 2009 -- Object-Oriented Programming Sophia Drossopoulou, 2009-06-30 Welcome to the proceedings of ECOOP 2009 Thanks to the local organizers for working hard on arranging the conference with the hard work they put in it was a great success Thanks to Sophia Drossopoulou for her dedicated work as PC Chair in assembling a new scientific program including forward looking keynotes and for her efforts to reduce the environmental impact of the PC meeting by replacing a physical meeting with a virtual meeting I would also like to thank James Noble for taking the time and effort to write up last year's banquet speech so that it could be included in this year's proceedings One of the strong features of ECOOP is the two days of workshops preceding the main conference that allows intense interaction between participants Thanks to all workshop organizers Last year

successful summer school tutorials were followed up this year with seven interesting tutorials. Thanks to the organizers and speakers. This year's Dahl Nygaard award honored yet another pioneer in the field, namely David Ungar, for his contributions including Self. I appreciate his efforts in providing us with an excellent award talk. The world is changing and so is ECOOP. Please contemplate my short note on the following pages entitled "On Future Trends for ECOOP".

Psychology of Programming J.-M. Hoc, 2014-05-19. Psychology provides a backdrop for most of the study of human-computer interaction. In this volume, the psychological issues that pertain to programming rather than systems design are examined in four sections: Theoretical and Methodological Issues, Language Design and Skill Acquisition, Expert Programming, and the Future. The book was inspired by working groups in France and the United Kingdom but also includes work by major North American figures such as Curtis and Soloway. It is the first comprehensive work on this topic since the early 1980s.

Concepts, Techniques, and Models of Computer Programming Peter Van Roy, Seif Haridi, 2004-02-20. Teaching the science and the technology of programming as a unified discipline that shows the deep relationships between programming paradigms. This innovative text presents computer programming as a unified discipline in a way that is both practical and scientifically sound. The book focuses on techniques of lasting value and explains them precisely in terms of a simple abstract machine. The book presents all major programming paradigms in a uniform framework that shows their deep relationships and how and where to use them together. After an introduction to programming concepts, the book presents both well-known and lesser-known computation models, programming paradigms. Each model has its own set of techniques, and each is included on the basis of its usefulness in practice. The general models include declarative programming, declarative concurrency, message passing, concurrency, explicit state, object-oriented programming, shared state, concurrency, and relational programming. Specialized models include graphical user interface programming, distributed programming, and constraint programming. Each model is based on its kernel language, a simple core language that consists of a small number of programmer-significant elements. The kernel languages are introduced progressively, adding concepts one by one, thus showing the deep relationships between different models. The kernel languages are defined precisely in terms of a simple abstract machine. Because a wide variety of languages and programming paradigms can be modeled by a small set of closely related kernel languages, this approach allows programmer and student to grasp the underlying unity of programming. The book has many program fragments and exercises, all of which can be run on the Mozart Programming System, an Open Source software package that features an interactive incremental development environment.
