Reactive Modifiers for Polymers S. Al-Malaika, 2012-12-06 Chemical modification of polymers by reactive modifiers is no longer an academic curiosity but a commercial reality that has delivered a diverse range of speciality materials for niche markets reactively grafted styrenic alloys maleated polyolefins super tough nylons silane modified and moisture cured polyolefins and thermoplastic elastomers are but few examples of commercial successes Although the approach of reactive modification of polymers has been largely achieved either in solution or in the solid state through in situ reactions in polymer melts it is the latter route that has

attracted most attention in the last two decades owing to its flexibility and cost effectiveness. This route referred to as reactive processing focuses on the use of suitable reactive modifiers and the adoption of conventional polymer processing machinery, an extruder or a mixer as a chemical reactor to perform in situ targeted reactions for chemical modification of preformed polymers. This relatively simple though scientifically highly challenging approach to reactive modification offers unique opportunities in exploiting various reactive modifiers for the purpose of altering and transforming in a controlled manner the properties of preformed commercial polymers into new specialty materials with tailor-made properties and custom designed performance for target applications. Such an economically attractive route constitutes a radical diversion away from the traditional practices of manufacturing new polymers from monomers which involves massive investments in sophisticated technologies and chemical plants.

Polymer Science: A Comprehensive Reference, 2012-12-05

The progress in polymer science is revealed in the chapters of *Polymer Science: A Comprehensive Reference* Ten Volume Set. In Volume 1 this is reflected in the improved understanding of the properties of polymers in solution in bulk and in confined situations such as in thin films. Volume 2 addresses new characterization techniques such as high resolution optical microscopy, scanning probe microscopy and other procedures for surface and interface characterization. Volume 3 presents the great progress achieved in precise synthetic polymerization techniques for vinyl monomers to control macromolecular architecture, the development of metallocene and post metallocene catalysis for olefin polymerization, new ionic polymerization procedures and atom transfer radical polymerization, nitroxide mediated polymerization and reversible addition fragmentation chain transfer systems as the most often used controlled living radical polymerization methods. Volume 4 is devoted to kinetics, mechanisms and applications of ring opening polymerization of heterocyclic monomers and cycloolefins, ROMP as well as to various less common polymerization techniques. Polycondensation and non chain polymerizations including dendrimer synthesis and various click procedures are covered in Volume 5. Volume 6 focuses on several aspects of controlled macromolecular architectures and soft nano objects including hybrids and bioconjugates. Many of the achievements would have not been possible without new characterization techniques like AFM that allowed direct imaging of single molecules and nano objects with a precision available only recently. An entirely new aspect in polymer science is based on the combination of bottom up methods such as polymer synthesis and molecularly programmed self assembly with top down structuring such as lithography and surface templating as presented in Volume 7. It encompasses polymer and nanoparticle assembly in bulk and under confined conditions or influenced by an external field including thin films, inorganic organic hybrids or nanofibers. Volume 8 expands these concepts focusing on applications in advanced technologies e.g. in electronic industry and centers on combination with top down approach and functional properties like conductivity. Another type of functionality that is of rapidly increasing importance in polymer science is introduced in volume 9. It deals with various aspects of polymers in biology and medicine including the response of living cells and tissue to the

contact with biofunctional particles and surfaces The last volume is devoted to the scope and potential provided by environmentally benign and green polymers as well as energy related polymers They discuss new technologies needed for a sustainable economy in our world of limited resources Provides broad and in depth coverage of all aspects of polymer science from synthesis polymerization properties and characterization methods and techniques to nanostructures sustainability and energy and biomedical uses of polymers Provides a definitive source for those entering or researching in this area by integrating the multidisciplinary aspects of the science into one unique up to date reference work Electronic version has complete cross referencing and multi media components Volume editors are world experts in their field including a Nobel Prize winner
