Macroeconomic Risk Management Against Natural Disasters Stefan Hochrainer, 2007-12-14 Looking back in history we conceive the twentieth century as the century of wars Most likely we will conceive the twenty first century as the century of natural catastrophes Wars can be avoided unfortunately it did not happen often in history in contrast most natural disasters are outside human influence However the consequences of disasters can be alleviated by means of risk management For an effective risk management information is needed about i the size of the risk measured by the frequency and intensity of the hazard and ii the degree of vulnerability of the economy and society Stefan Hochrainer's thesis deals with measuring and modeling of both While the physical risk modeling is a well developed area within statistical modeling frequency analysis point processes extreme value theory etc estimating the economic consequences is a more challenging task The author studies economic effects of catastrophes by statistical analysis of macroeconomic data One interesting finding is that disasters can decrease the absolute level of economic performance such as the GDP while keeping growth levels nearly the same at least after some years as in the pre disaster years The boom of new products in the financial markets

especially of new derivative instruments has led to new risk hedging instruments such as catastrophe bonds CAT bonds transfer the risk to the market of investors **Disaster Insurance** United States.
