Silinsh, 2012-12-06 This book is based on the results of many years of experimental work by the author and his colleagues dealing with the electronic properties of organic crystals E Silinsh has played a leading role in pointing out the importance of the polarization energy by an excess carrier in determining not only the character of the carrier mobility in organic crystals but in determining the band gap and the nature of the all important trapping site in these crystals The one electron model of electronic conductivity that has been so successful in dealing with inorganic semiconductors is singularly unsuccessful in rationalizing the unusual physical properties of organic crystals A many body theory is required and the experimental manifestation of this is the central role played by the crystal polarization energies in transferring the results obtained with the isolated molecule to the solid The careful studies of E Silinsh in this field have shown in detail how this polarization energy develops around the excess carrier and also the hole electron pair sitting on a molecular site in the crystal As with all insulators trapping sites play a dominant role in reducing the magnitude of the current that can theoretically pass through the organic crystal It is usually the case that these trapping sites are energetically distributed within the forbidden band of the crystal For many years an exponential distribution has shown itself to be useful and reasonably correct However E

Official Year Book of the Commonwealth of Australia No. 14 - 1921 , **Rock Piles and Field Clearing Practices on Historic Farms and Pastures in Northeastern United States** James E. Gage, Mary E. Gage, 2024-11-01 It is hard to imagine that the most controversial subject in 21st century northeastern archaeology concerns rock piles found on historic farm lands Yet rock piles are at the heart of a contentious debate about their cultural affiliation purpose and age Are they agricultural field clearing piles or Indigenous ceremonial features The short answer is some are the byproduct agricultural activities while others were intentionally built as an expression of Indigenous spiritual beliefs How do we distinguish between the two In order to answer

that question it is necessary to have a solid historical and scientific understanding of field clearing practices in northeastern United States Using farm manuals and 19th century agricultural journals this book delves into the surprisingly complex topic of stone removal and disposal practices on farms in northeastern United States and beyond It establishes some basic criteria for identifying clearing piles Groups of Indigenous stone features including rock piles cairns have survived on unfarmed lands and old pastures They have largely been misidentified as field clearing piles and attributed to efforts to improve soil quality However new research shows that permanent pastures were rarely if ever cleared of stones 19th century farmers had a solid understanding of why their pastures were being degraded and the solutions they needed to fix them None of those solutions involved stone removal This book draws together in a single volume over a decade of intensive research into an obscure but critically important topic in historic archaeology Agricultural field clearing features are not considered archaeological significant Ceremonial landscapes traditional cultural properties are considered culturally sensitive sites Distinguishing between the two is an important task [The Pictorial Field-Book of the Revolution](#) Benson J.
