

ser, the elaborate pecked and polished stone "mortars" of the central highlands occur in no context suggesting a use for food preparation, or even grinding; they are not so used ethnographically.

In Tasmania, where 19th-century natives did not eat fish, the earliest human debris found so far shows fish constituting up to 20 percent of the meat consumed. These lower levels of the earliest Tasmanian site—Rocky Cave, in the northwest—show a gradual increase in the proportion of unmodified bones to bone tools (from five marsupial bones per bone tool to 68 bones per bone tool). A comparable change is signaled by the increase in the proportion of stone tools to bone tools (from two to 20 stone tools per bone tool). Later levels of the Rocky Cave site lack bone tools. Such items were used by 19th-century Tasmanians in the making of bark canoes, skin cloaks, and water containers.

A weakness in White and O'Connell's overview is their uncritical acceptance of the work of some of their colleagues. Foremost of these oversights is the lack of challenge of the radiocarbon dating of Lake Mungo material. This site group has a date of 33,000 to 24,000 years ago derived from "freshwater mussel shell." Major radiocarbon specialists have long concluded that freshwater shell is not a sound basis for dating a culture; it often yields overly old results, yet sometimes the dates are skewed in the opposite direction; possibly such material should simply not be submitted for dating.

If the Lake Mungo date is unacceptable, what is at present the earliest proof of human occupation of Sahul? Review of White and O'Connell's presentation suggests it is to be found in levels 28 through 30, at Devil's Lair, where dates of 24,000 to 27,000 years ago have been reported.

White, O'Connell, and their Australian (and American Australianist) colleagues are to be complimented that only 25 years after the first work by professionally trained archeologists, only 15 years after the production of the first locally awarded Ph.D., such a series of stimulating findings concerning a continuum has been produced. New models for evolutionary change, both biological and cultural, have been offered. North American scholars should not overlook the work in Sahul prehistory. We can but hope that overviews of the quality of this work will be produced regularly.

Classic Ore Deposits

Precambrian Sulphide Deposits. H. S. Robinson Memorial Volume. R. W. HUTCHINSON, C. D. SPENCE, and J. M. FRANKLIN, Eds. Geological Association of Canada, Waterloo, 1982 (distributor, GAC Publication Division, Business and Economic Service, Toronto). viii, 792 pp., illus. C\$57; to members, C\$47. Geological Association of Canada Special Paper 25.

About half of this book is made up of papers presented at a symposium sponsored by the Geological Association of Canada during their joint meeting with the Geological Society of America and the Mineralogical Association of Canada in Toronto in 1978. The other half is made up of solicited papers. The book has been a long time in coming, but it turns out to be well worth the wait, and, fortunately, the papers are not of the type that becomes dated rapidly.

The book opens with a paper comparing the metallogeny of the Superior, Slave, and Churchill provinces, in large part a comprehensive summary of deposits, their production history and reserves, with notes concerning their geological setting. Three papers then follow describing the geology of specific areas; these are a curious inclusion, since the areas described are relevant to only a few of the deposits covered in the book.

The nucleus of the book is a series of 18 papers describing massive sulfide deposits, all but two of which are located in Canada. Nine of the deposits would be accepted by all economic geologists as volcanogenic massive sulfides. The papers describing most of the deposits ascribe their origin to exhalations of hot brines on the sea floor. Relatively little is contributed in the way of advancing our understanding of exhalative processes, but the papers provide a valuable account of the geology of this class of deposit. Particularly welcome are the first comprehensive account of the large Crandon deposit in Wisconsin and the description of the classic, highly metamorphosed Geco deposit north of Lake Superior. The Agnico Eagle deposit has all of the hallmarks of a volcanogenic massive sulfide deposit, but it carries gold rather than copper and zinc. The paper describing it provides important input into the current argument about the formation of Archean gold deposits.

Whether because of legal complications, the number of geologists involved in their study, or just their complexity, some of the world's classic deposits are never written up comprehensively. In this regard, a paper in the book on the

160-million-ton Sullivan ore body rectifies a major lack. Finally, we learn from COMINCO geologists in print what they have been showing us during mine tours for so many years—that the deposit is exhalative in a sedimentary setting, that it is located within a former sea-floor depression, and that the massive core of the deposit overlies the main conduit for the mineralizing brines.

A paper on the Redstone copper belt of the Mackenzie Mountains is an important addition to the Copper Belt literature, because it reviews the geology of the area in the light of recent ideas on the significance of the sebkha environment to the genesis of this type of deposit. In the current economic climate these deposits constitute perhaps the most attractive target for copper exploration, and this paper is a must for anyone interested in identifying the environment in which such copper deposits are likely to occur.

The Thompson nickel belt is underrepresented in the literature, and thus a paper on it in the book is welcome. The paper is important in that it emphasizes the volcanic rocks of the belt more than has been done in the past, pointing out that highly magnesian lavas are present. Personally, I was disappointed that individual deposits did not receive more attention, including more plans and cross sections and data on metal ratios, if not grades. The district is 25 years old, and a summary of deposits and prospects, their approximate size and type, as has been provided for the much more recent Kambalda nickel camp in Western Australia, would have been most helpful.

Though the Thompson deposits are interpreted on the basis of a magmatic model, Robinson and Hutchinson interpret the Redstone nickel sulfide deposit, associated with Archean komatiite flows (in Ontario and having nothing to do with the Redstone copper belt of the Northwest Territory) as exhalative. Their key evidence is the presence of a metasomatically chloritized dacite layer between the ore and the overlying ultramafic rocks, which would prevent the sulfides from settling directly from the latter. In a summary paper Hutchinson also refers to nickel sulfides interbedded with chert at Jan shoot, Western Australia, as evidence of an exhalative origin. I have seen the location at Jan; the interbedded sulfide and chert occur within a zone across which massive sulfides grade into sulfide-free banded chert and in which the sulfides appear to be penetrating and replacing the chert. Anyone who has had occasion to handle molten iron sulfide oxide liquids knows the ex-
