

# Management of drug misuse in pregnancy

Ed Day & Sanju George

**Abstract** Use of both licit and illicit drugs can lead to a range of medical, psychiatric and social problems, and the situation becomes further complicated if the user is pregnant. Prescribed and non-prescribed substances can affect a pregnancy, and substances are seldom used in isolation. In this review we focus on users of illicit drugs (including prescribed drugs used illicitly) during pregnancy and describe some of the issues in managing such cases. We consider the impact of substance use on the foetus, the mother and the newborn child, and highlight the importance of multidisciplinary working in this area. Space precludes a detailed account of the issues surrounding the use of legal substances such as alcohol and tobacco during pregnancy, but we note their significant impact in this group.

It is difficult to estimate accurately the prevalence of high-risk drug use during pregnancy for a variety of reasons: feelings of shame, denial and stigma experienced by the drug user, lack of awareness among professionals in antenatal services, the presence of comorbid psychiatric disorders, and sociocultural barriers that may prevent a thorough assessment. However, we know that about one-third of drug users in treatment in the UK are female, and over 90% of these women are of childbearing age (15–39 years). A number of large surveys of drug use in different populations conducted in the USA provide a further insight. For example, the National Pregnancy and Health Survey gathered self-report data from a sample of 2613 women whose babies were delivered in 52 urban and rural hospitals during 1992 (National Institute of Drug Abuse, 1996). Over 5% of those who gave birth during the study period had used illicit drugs while they were pregnant, with 2.9% using cannabis and 1.1% using cocaine at some point in their pregnancy (compared with 20% smoking tobacco and 18.5% drinking alcohol). A further report combined 2 years of US National Household Survey data (1994 and 1995) for women and girls 15–44 years old and found that 9.3% reported current use of illicit drugs, with 2.3% doing so while pregnant. The problem is therefore a significant one, particularly as it has implications for both mother and child.

## Effects of drug use on the mother

Dependence on heroin or other drugs can lead to neglect in many areas of the user's life. The need to obtain a steady supply of the drug is both time-consuming and expensive, and so neglect of medical, nutritional and social well-being is common. Injected drug use leads to an increased risk of acquiring blood-borne viruses such as HIV and hepatitis, as well as abscesses and endocarditis. Maternal infection, neglect and malnourishment are partly responsible for the observed low birth weights, high incidence of preterm birth and poor nutritional status of neonates born to drug users (Fischer, 2000). Women may become involved in crime such as prostitution, robbery and burglary in an attempt to finance their drug habit.

## Parenting issues

Parental drug use during and after pregnancy can have a serious impact on the emotional, cognitive and behavioural development of children. It has been estimated that 20 000–30 000 children in England and Wales have one or both parents with a serious drug problem (Advisory Council on the Misuse of Drugs, 2000). After the birth, parental drug use may present the child with a range of difficulties that can

**and Childhood** Roland R. Watson, 2012-12-06 Alcohol and other drugs of abuse cause significant physiological changes especially during development. The effects on the infant and child range from severe mental retardation to mild changes in activity and neurological functions. Although the level of intake needed to cause fetal damage is not clear, the magnitude of the problem is significant with many long-term sequelae. As a result, it becomes critical to better diagnose and manage drug and alcohol use during pregnancy. This must involve special training for health care professionals. In addition, recognition of the psychosocial factors affecting alcohol use especially by youth and young adults is critical to modifying behavior and thus reducing fetal alcohol exposure. Cultural considerations can also come into play in modifying alcohol and drug use by women so as to reduce fetal damage. The trends in alcohol and drug use by youth forecast rising levels of damage to infants. These children will need extensive medical and educational care for years to decades. Clearly, understanding of the role women must take in modifying their alcohol and drug use during pregnancy will facilitate changes in our cultural and educational practices that will help reduce fetal trauma from alcohol.

**Drug Use in Pregnancy: Mother and Child** I.J. Chasnoff, 1986-08-31 Abstract A reference text for medical and paramedical personnel involved in the care of pregnant women and their children presents 13 detailed reviews on various aspects of the topic prepared by experts in their respective fields. Topics include the pharmacological basis of perinatal drug addiction and its recognition and treatment; obstetric aspects of drug use in pregnancy; presentation and application of a comprehensive model for therapy; the consequences of intrauterine exposure to opiate and other drugs; the effects of marijuana, alcohol, and psychotropic drug abuse; methodological issues in investigating pregnancy drug abuse; immunological function and AIDS in drug-exposed infants; and legal issues. Literature references are appended to each of the papers.

**Handbook of Substance Misuse and Addictions** Vinood B. Patel, Victor R. Preedy, 2022-10-17 Substance misuse and addictions are a public health issue. They affect the well-being of each community and nation as a whole. It is therefore necessary to identify, educate, and treat individuals who are addicted to substances. Policies and procedures go hand in hand with public health education and safety. The science behind the public health issues of one drug may be applicable to other drugs as well. However, marshalling all of the aforementioned information into a single source is somewhat difficult due to the wide array of material. The Editors address this by compiling the research in this single reference work that serves as a one-stop shopping approach to everything readers need to know about the scientific basis of public health and addictions and agents of misuse. Apart from active agents that have a plant or chemical basis, there is a need to consider that there are other forms of addiction which may have common modes of causality or prevention. These include food addiction, gaming, gambling, and other non-drug addictions. These types of addiction may be related to the addiction of drugs. The Handbook of Substance Misuse and Addictions: From Biology to Public Health offers a holistic understanding of the relationship between public health and substance misuse. The text provides a common platform upon which other forms of addiction or substance misuse can be understood and treated. Addiction processes involve

understanding the biological processes as well as behavior psychology sociology and public health all of which are interlinked This Handbook is a useful reference for lecturers students researchers practitioners and other professionals in public health addiction science epidemiology health education health promotion and health sciences The Effects of Maternal Alcohol and Drug Abuse on the Newborn Barry Stimmel,1982 Drug abuse and alcoholism specialists present the latest findings on the effects on the newborn of mothers use of illicit drugs during pregnancy These experts specifically address the perinatal neonatal and subsequent developmental effects **Alcohol and Drug Misuse** Iosief Abraha,2012 *Women & substance misuse in Ireland: overview* , **Handbook on Drug Abuse** ,1979 *Smoking, Drinking, and Drug Use in Young Adulthood* Jerald G.
