Andreucci, Leon G. Fine, 2012-12-06 Nephrology initially born as a small branch of medicine has in the last few decades become an extraordinary large field of medicine The recent development of renal medicine is mirrored by the numerous nephrological journals published a natural consequence of the increasing number of basic and clinical research studies performed continuously all over the world Undoubtedly the progress which has occurred in the different specific fields of renal medicine has given rise to subspecialties which range from renal physiology and pathology to hemo and peritoneal dialysis and renal transplantation Even the diagnostic

methodology in nephrology very useful in the clinical practice has become a speciality within the speciality Thus the problem for clinical nephrologists as well as for internists is to remain continuously up dated in all fields of nephrology Nephrology textbooks are published continuously and in great number However the time required for having authors appointed chapters completed manuscript edited galley proofs corrected and the whole book printed makes many textbooks already out of date when they go on sale and their half lives are very short On the other hand nephrological journals are so many and the articles so numerous and detailed that it is often impossible to rely on them for up dating practicing clinicians

Hypertension in Kidney Disease J.S. Cheigh,K.H Stenzel,A.M. Rubin,2012-12-06 Blood pressure control is central to all bodily functions There are many points in the multifaceted cybernetic system wherein hypertension may be produced Hypertension is a young disorder whose existence has been known for less than a century It is not only extremely prevalent among every population but also deleterious to the health of mankind The more we understand about hypertension s harmful effects the more urgent is the need for its effective control The kidney is the central organ that controls vascular tone and body fluid volume these two factors are dominant in determining arterial blood pressure Hence it is not surprising to find in hypertensive disorders that there are abnormalities in the kidneys functional or anatomical subtle or overt that cause or are the consequence of hypertension The first suggestion that the kidney could cause hypertension was made in 1836 before arterial pressure could even be measured by Richard Bright He observed that cardiac hypertrophy was often present in patients who died of renal disease It was however Goldblatt and his colleagues in 1934 who opened the modern era of experimental and clinical research in renal hypertension Since then although far from complete enthusiastic and intensive research efforts have greatly improved our understanding of the nature of renal hypertension
