Recent Developments in Prophylactic Immunization Francis J. Zucker, 2012-12-06 It has been said that never in the history of human progress has a better and cheaper method of preventing illness been developed than immunization This is well illustrated by the WHO Expanded Programme on Immunization EPI which in developing countries is now preventing nearly a million deaths annually from measles pertussis and neonatal tetanus and for which there is a commitment by the WHO and UNICEF to protect all children by immunization by the end of the decade This enormous undertaking will be facilitated by the rapid advances in molecular biology and recombinant DNA technology in the understanding of immunological mechanisms and by the production and application of monoclonal antibodies so that the structure and location of important antigenic determinants or epitopes can be determined Chemical synthesis of oligopeptides has been simplified and computer programmes and X ray crystallography provide the tools for the determination of three dimensional structure of proteins so that the structure and location of important antigenic determinants or epitopes can be predicted These techniques have opened the way to the improvement of existing vaccines and to the development and production of new vaccines against infections for which vaccines are not available New vaccines under development include vaccines against hepatitis B hepatitis A malaria vaccines for typhoid cholera rota virus infection and other diarrhoeal diseases leprosy rabies the acquired immune deficiency syndrome AIDS rubella EB virus schistosomiasis and other infections These recent developments are discussed in the volume by internationally recognized experts assembled from several countries

Abraham,2012-12-06 It was not too long ago that many physicians and biomedical scientists felt that the era of vaccines for protecting mankind against infectious disease was coming to an end During the 1940s and 50s the widespread use of newly developed antibiotics and antimicrobial chemotherapeutic agents suggested a new era in medicine i e the control and eventual elimination of all infectious diseases at least those caused by bacteria by chemical means The magic bullet proposed by Paul Ehrlich in the early 1900s seemed to be the method of choice for controlling infection However it is now quite evident that those high expectations were unwarranted Although many acute infections especially those caused by pyogenic cocci have been controlled by antibiotics it is quite evident that infectious diseases even those caused by bacteria still are a major problem Thus the old standby of preventative vaccination is making a strong comeback not only for viral but also for bacterial infections However except for a relatively small number of viral diseases and those bacterial diseases due to toxin elaborated by microorganisms rather than invasion and replication of the microbe per se preventative vaccination still has not fulfilled the expectations of their proponents There has been a recent resurgence of interest concerning all aspects of vaccines not only their preparation and administration but also the nature and mechanism of the host immune response to the constituent micro organisms and their products *Pharmacology in Rehabilitation, Updated 5th Edition* Charles D. Ciccone,2022-01-24 Up to date must know coverage Bring your understanding of the rapidly evolving world of pharmacological agents and their impact on rehabilitation up to date with the Updated 5th Edition of this groundbreaking reference An easy to understand

New Treatment Strategies for Dengue and Other Flaviviral Diseases Gregory R. Bock, Jamie A. Goode, 2006-10-02 Dengue virus is a member of the Flaviviridae family which includes viruses associated with human diseases such as yellow fever Japanese encephalitis and hepatitis C Dengue fever is transmitted by mosquitoes principally *Aedes aegypti* There are four serotypes of dengue virus of which DENV 2 has been the most prevalent in many recent epidemics Following primary infection lifelong immunity develops preventing repeated assault by the same serotype However the non neutralizing antibodies from a previous infection or maternally acquired antibodies are thought to form complexes with a different serotype during a subsequent infection and cause dengue haemorrhagic fever dengue shock syndrome which can be fatal There is no treatment or vaccine available today that can combat this emerging and uncontrolled disease This book features contributions from the world's leading researchers working on dengue and related flaviviruses who examine the current state of the art in the molecular biology of the dengue virus Particular emphasis

is placed on the structure and function of the virus and the targeting of virus proteins by potential antiviral agents The pathogenesis of dengue and dengue haemorrhagic fever are discussed in detail especially the target cells and the specific receptors on these cells thereby developing a clear overview of host and viral factors that contribute to dengue haemorrhagic fever Finally the book reviews the therapeutic options paying particular attention to ways in which vector host and environment can play a critical role in the spread of this disease With dengue fever and other emerging viral diseases becoming increasingly prevalent around the world this book provides valuable insight into the virus that causes this disease and potential ways to manage it It is essential reading for all those working in tropical diseases public health and virology Praise from the reviews The book provides an excellent summary of dengue flavivirus research and is important for individuals and institutions interested in emerging infectious diseases MICROBIOLOGY TODAY

New Vaccines and Chemotherapy Edouard Kurstak, R.G. Marusyk, F.A. Murphy, M.H.V. Van Regenmortel, 2013-12-01 Viral Vaccines Joseph L Melnick As with history in general the history of vaccines needs to be reexamined and updated My task is to look back to see what has been successful and to look forward to see what remains to be accomplished in the prevention of viral diseases by vaccines Also I shall refer to the pertinent material discussed at two recent conferences of the Institute of Medicine National Academy of Sciences on virus vaccines under development and their target populations in the United States 1985b and in developing

countries 1986 These reports plus a third on Vaccine Supply and Innovation 1985a should be required reading for all those in both the public and the private sector who have a responsibility or interest in vaccines for the prevention of human disease It has been through the development and use of vaccines that many viral diseases have been brought under control The vaccines consist either of infectious living attenuated viruses or of noninfectious killed viruses or subviral antigens When we look at the record it is the live vaccines that have given the great successes in controlling diseases around the world
