Receptors For Extracellular Matrix:

Receptors For Extracellular Matrix John McDonald, 2012-12-02 Receptors for Extracellular Matrix covers the major receptor families and their potential biological functions. Composed of eight chapters, the book first discusses the structure and function of membrane-associated proteoglycans, focusing on two classes of integral membrane molecules: syndecan and CD44. It then examines the important area of mechanisms of signal transduction from integrin receptors that must mediate the effects of extracellular matrices and other ligands on cell behavior. Multidomain proteins of the extracellular matrix and their role in controlling cellular growth are also considered. This book also discusses the significant research developments in NCAM, the most abundant and widespread of the known vertebrate cell-cell adhesion molecules. The discussion particularly emphasizes the role of posttranslational glycosylation with polysialic acid in the function of the NCAM molecule that undergoes unusual and highly characteristic differences in glycosylation during development. Other chapters deal with the regulation of neural development by the extracellular matrix and the molecular basis of cell adhesion. This book includes discussions on the interaction of adhesion receptors with well-characterized cellular recognition sites and extracellular ligands and cell migration occurring during embryogenesis, gastrulation, neural crest cell migration, neurite extension, lymphocyte migration, and wound healing. The concluding chapters address the wide array of integrin associations, their physiologic relevance, and structural aspects, as well as the anchoring of integrins to the cytoskeleton. This book is of great value to cell biologists and researchers.

Integrins David A. Cheresh, Robert P. Mecham, 1994-09-26 Integrins: Molecular and Biological Responses to the Extracellular Matrix will help basic, applied, and clinical researchers keep up with the explosion of literature on the integrin family of proteins. This volume extends material previously covered in Receptors for Extracellular Matrix. It addresses some of the most exciting areas of integrin biology, including the varied roles of integrins in cell division, differentiation, movement, wound healing, inflammation, thrombosis, osteoporosis, and cancer. Describes key aspects of integrin structure, function, and biology. Covers collagen receptors, epithelial cell integrins, leukocyte integrins, platelet integrins, integrin signaling, and integrin antagonists. Investigates the expression and role of integrins during development and in the cytoskeleton. Includes the actions and influences of integrins in inflammation, thrombosis, and osteoporosis.

Matricellular Receptors as Potential Targets in Anti-Cancer Therapeutic Strategies Hervé Emonard, Stéphane Dedieu, Laurent Duca, 2016-11-22 The invasive character of a primary cancer is greatly dependent on numerous interactions between tumor cells and their extracellular surroundings. Matricellular receptors are defined as cell surface receptors that bind extracellular matrix (ECM) structural proteins and soluble factors, dynamically acting on ECM homeostasis. Matricellular receptors mediate numerous signalings from the extracellular environment to the cell nucleus and drive main biological functions that are cell growth, survival, and migration. Numerous data from the last decade evidence that matricellular receptors are biosensors that allow a tumor cell to answer to microenvironmental variations, and in this

sense they are important contributors to tumor cell malignancy. Matricellular receptors represent thus valuable targets for the development of original anti cancer strategies. Original reports, bibliographic reviews or hypotheses are welcome to improve the basic knowledge of matricellular receptor properties, their spatio temporal regulation, the dynamic formation of complex receptors and the impact of such interactions on the invasive properties of tumor cells. Biological, biophysical and pharmacological as well as in silico contributions will be appreciated.

Principles of Tissue Engineering Robert Lanza, Robert Langer, Joseph P. Vacanti, 2011-10-13. First published in 1997, *Principles of Tissue Engineering* is the widely recognized definitive resource in the field. The third edition provides a much needed update of the rapid progress that has been achieved in the field, combining the prerequisites for a general understanding of tissue growth and development, the tools and theoretical information needed to design tissues and organs, as well as a presentation by the world's experts of what is currently known about each specific organ system. This edition includes greatly expanded focus on stem cells, including adult and embryonic stem cells and progenitor populations that may soon lead to new tissue engineering therapies for heart disease, diabetes and a wide variety of other diseases that afflict humanity. This up to date coverage of stem cell biology and other emerging technologies is complemented by a series of new chapters on recent clinical experience in applying tissue engineering. The result is a comprehensive textbook that we believe will be useful to students and experts alike. New to this edition: Includes new chapters on biomaterial, protein interactions, nanocomposite and three dimensional scaffolds, skin substitutes, spinal cord vision enhancement and heart valves. Expanded coverage of adult and embryonic stem cells of the cardiovascular, hematopoietic, musculoskeletal, nervous and other organ systems.

Interplay Between Cell-surface Receptors and Extracellular Matrix in Skin Svenja Kleiser, Alexander Nyström, 2020. Abstract: Skin consists of the epidermis and dermis which are connected by a specialized basement membrane, the epidermal basement membrane. Both the epidermal basement membrane and the underlying interstitial extracellular matrix (ECM) created by dermal fibroblasts contain distinct network forming macromolecules. These matrices play various roles in order to maintain skin homeostasis and integrity. Within this complex interplay of cells and matrices, cell surface receptors play essential roles not only for inside out and outside in signaling but also for establishing mechanical and biochemical properties of skin. Already minor modulations of this multifactorial cross talk can lead to severe and systemic diseases. In this review, major epidermal and dermal cell surface receptors will be addressed with respect to their interactions with matrix components as well as their roles in fibrotic, inflammatory or tumorigenic skin diseases.

Receptors of Cell Adhesion and Cellular Recognition A.G. Lee, 1996-06-25. Volume 3 of *Biomembranes* covers receptors of cell adhesion and cellular recognition. Proteins in the plasma membrane of cells are heavily involved in processes of cell adhesion but such proteins were not actually isolated and characterized until the mid 1970s. Since then, application of the methods of molecular biology has led to the recognition of four major classes of cell adhesion molecules: CAMs, the immunoglobulin super family, the cadherins, the integrins and the

selecting A convenient system in which to study the importance of cell adhesion is in blood platelets where aggregation eventually leads to thrombus formation in a process involving a range of surface glycoproteins Interaction with the extracellular matrix is exemplified by CD44 the receptor for hyaluronan and a complex carbohydrate that is a major component of the extracellular matrix surrounding migrating and proliferating cells Membrane associated mucins have a variety of effects on cell adhesion The super family of immunoglobulin related proteins also include the T cell receptors and the major histocompatibility complex MHC which together with the receptors for immunoglobulins the Fc receptors are of fundamental importance in the processes of immunity Volume 3 of Biomembranes explores the structures and functions of the molecules involved in these important functions of the cell Cumulated Index Medicus ,2000 *Discoidin Domain Receptors in Health and Disease* Rafael Fridman,Paul H. Huang,2016-08-13 The interactions of cells with their surrounding extracellular matrix ECM plays a pivotal role in driving normal cell behavior from development to tissue differentiation and function At the cellular level organ homeostasis depends on a productive communication between cells and ECM which eventually leads to the normal phenotypic repertoire that characterize each cell type in the organism A failure to establish these normal interactions and to interpret the cues emanating from the ECM is one of the major causes in abnormal development and the pathogenesis of multiple diseases To recognize and act upon the biophysical signals that are generated by the cross talk between cells and ECM the cells developed specific receptors among them a unique set of receptor tyrosine kinases RTKs known as the Discoidin Domain Receptors DDRs The DDRs are the only RTKs that specifically bind to and are activated by collagen a major protein component of the ECM Hence the DDRs are part of the signaling networks that translate information from the ECM and thus they are key regulators of cell matrix interactions Under physiological conditions DDRs control cell and tissue homeostasis by acting on collagen sensors transducing signals that regulate cell polarity tissue morphogenesis cell differentiation and collagen deposition DDRs play a key role in diseases that are characterized by dysfunction of the stromal component which lead to abnormal collagen deposition and the resulting fibrotic response that disrupt normal organ function in disease of the cardiovascular system lungs and kidneys just to mention a few In cancer DDRs are hijacked by tumor and stromal cells to disrupt normal cell collagen communication and initiate pro oncogenic programs Importantly several cancer types exhibit DDR mutations which are thought to alter receptor function and contribute to cancer progression Therefore the strong causative association between altered RTK function and disease it is been translated today in the development of specific tyrosine kinase inhibitors targeting DDRs for various disease conditions In spite of the accumulating evidence highlighting the importance of DDRs in health and diseases there is still much to learn about these unique RTKs as of today there is a lack in the medical literature of a book dedicated solely to DDRs This is the first comprehensive volume dedicated to DDRs which will fill a gap in the field and serve those interested in the scientific community to learn more about these important receptors in health and disease *Principles of Cell Biology*

George Plopper, Diana Bebek Ivankovic, 2020-02-03 Principles of Cell Biology Third Edition is an educational eye opening text with an emphasis on how evolution shapes organisms on the cellular level Students will learn the material through 14 comprehensible principles which give context to the underlying theme that make the details fit together The Mobile Receptor Hypothesis David A.
