Property-preserving Numerical Schemes For Conservation Laws Dmitri Kuzmin, Hennes Hajduk, 2023-08-28 High order numerical methods for hyperbolic conservation laws do not guarantee the validity of constraints that physically meaningful approximations are supposed to satisfy The finite volume and finite element schemes summarized in this book use limiting techniques to enforce discrete maximum principles and entropy inequalities Spurious oscillations are prevented using artificial viscosity operators and or essentially nonoscillatory reconstructions An introduction to classical nonlinear stabilization approaches is given in the simple context of one dimensional finite volume discretizations Subsequent chapters of Part I are focused on recent extensions to continuous and discontinuous Galerkin methods Many of the algorithms presented in these chapters were developed by the authors and their collaborators Part II gives a deeper insight into the mathematical theory of property preserving numerical schemes It begins with a review of the convergence theory for finite volume methods and ends with analysis of algebraic flux correction schemes for finite elements In addition to providing ready to use algorithms this text explains the design principles behind such algorithms and shows how to put theory into practice Although the book is based on lecture notes written for an advanced graduate level course it is also aimed at senior researchers who develop and analyze numerical methods for hyperbolic problems **Numerical Methods for**

Conservation Laws Jan S. Hesthaven, 2018-01-30 Conservation laws are the mathematical expression of the principles of conservation and provide effective and accurate predictive models of our physical world Although intense research activity during the last decades has led to substantial advances in the development of powerful computational methods for conservation laws their solution remains a challenge and many questions are left open thus it is an active and fruitful area of research *Numerical Methods for Conservation Laws From Analysis to Algorithms* offers the first comprehensive introduction to modern computational methods and their analysis for hyperbolic conservation laws building on intense research activities for more than four decades of development discusses classic results on monotone and finite difference finite volume schemes but emphasizes the successful development of high order accurate methods for hyperbolic conservation laws addresses modern concepts of TVD and entropy stability strongly stable Runge Kutta schemes and limiter based methods before discussing essentially nonoscillatory schemes discontinuous Galerkin methods and spectral methods explores algorithmic aspects of these methods emphasizing one and two dimensional problems and the development and analysis of an extensive range of methods includes MATLAB software with which all main methods and computational results in the book can be reproduced and demonstrates the performance of many methods on a set of benchmark problems to allow direct comparisons Code and other supplemental material are available online at www.siam.org/books/cs18 **Numerical Methods for**
Conservation Laws Randall J. LeVeque, 2012-12-06 These notes developed from a course on the numerical solution of conservation laws first taught at the University of Washington in the fall of 1988 and then at ETH during the following spring

The overall emphasis is on studying the mathematical tools that are essential in developing analyzing and successfully using numerical methods for nonlinear systems of conservation laws particularly for problems involving shock waves A reasonable understanding of the mathematical structure of these equations and their solutions is first required and Part I of these notes deals with this theory Part II deals more directly with numerical methods again with the emphasis on general tools that are of broad use I have stressed the underlying ideas used in various classes of methods rather than presenting the most sophisticated methods in great detail My aim was to provide a sufficient background that students could then approach the current research literature with the necessary tools and understanding Without the wonders of TeX and LaTeX these notes would never have been put together The professional looking results perhaps obscure the fact that these are indeed lecture notes Some sections have been reworked several times by now but others are still preliminary I can only hope that the errors are not too blatant Moreover the breadth and depth of coverage was limited by the length of these courses and some parts are rather sketchy

Numerical Schemes for Conservation Laws Dietmar Kröner, 1997-03-06 This book systematically studies upwind methods for initial value problems for scalar conservation laws in one and multidimensions The mathematical theory of convergence theory and of a priori error estimates is presented in detail for structure finite difference methods as well as for unstructured grids finite volume methods Higher order schemes are also included In the second part of the book the algorithms for scalar equations are generalized into systems of conservation laws in one and multidimensions The most powerful schemes for the discretization of systems are described and numerical examples are presented In particular local grid refinement has been taken into account The initial boundary value problem is also considered for linear systems and nonlinear scalar conservation laws

Raviart,1996 This work is devoted to the theory and approximation of nonlinear hyperbolic systems of conservation laws in one or two spaces variables It follows directly a previous publication on hyperbolic systems of conservation laws by the same authors While in the earlier publication the authors concentrate on the mathematical theory of multidimensional scalar conservation laws in this work they consider systems and the theoretical aspects which are needed in the applications such as the solution of the Riemann problem and further insights into more sophisticated problems Entropy Aware Numerical Schemes for Hyperbolic Conservation Laws Simon-Christian Klein,2024 **Numerical Methods for Eulerian and Lagrangian Conservation Laws** Bruno Després,2017-07-09 This book focuses on the interplay between Eulerian and Lagrangian conservation laws for systems that admit physical motivation and originate from continuum mechanics Ultimately it highlights what is specific to and beneficial in the Lagrangian approach and its numerical methods The two first chapters present a selection of well known features of conservation laws and prepare readers for the subsequent chapters which are dedicated to the analysis and discretization of Lagrangian systems The text is at the frontier of applied mathematics and scientific computing and appeals to students and researchers interested in Lagrangian based computational fluid dynamics It also serves as an introduction to the recent corner based Lagrangian finite volume techniques *Godunov Methods* E.F. Toro,2012-12-06 This edited review book on Godunov methods contains 97 articles all of which were presented at the international conference on Godunov Methods Theory and Applications held at Oxford in October 1999 to commemorate the 70th birthday of the Russian mathematician Sergei K Godunov The meeting enjoyed the participation of 140 scientists from 20 countries one of the participants commented everyone is here meaning that virtually everybody who had made a significant contribution to the general area of numerical methods for hyperbolic conservation laws along the lines first proposed by Godunov in the fifties was present at the meeting Sadly there were important absentees who due to personal circumstance could not attend this very exciting gathering The central theme of the meeting and of this book was numerical methods for hyperbolic conservation laws following Godunov's key ideas contained in his celebrated paper of 1959 But Godunov's contributions to science are not restricted to Godunov's method
