Neuronal Operations in the Visual Cortex G.A. Orban, 2012-12-06 The invitation by the editors of the series studies of brain function to contribute a monograph on the visual cortex gives me the opportunity to present in a concentrated manner much of the work I have done on the visual cortical areas of cat and monkey However the field of visual cortical physiology is so active and so diverse that the presentation of only my own work would have given a very incomplete view of visual cortical functioning Therefore this monograph also reviews most of the studies carried out on the subject in the last two decades Where possible I have tried not only to describe the cortical machinery but also its possible functional purpose regarding vision In doing this I have expressed my personal views rather than just reviewing the experimental facts Much of the work presented in this monograph has been supported by the National Research Council of Belgium and the Research Council of the Catholic University of Leuven I express my gratitude to them I have enjoyed collaborating in these studies with P O Bishop H Kato H Kennedy K P Hoffmann H Maes J Duysens E Vandenbussche and H van der Glas I am much indebted to all those who have commented on earlier versions of this monograph J Allman H Barlow J BuBier M Callens J Duysens O J Griisser P Heggelund H Kennedy L C Orban and L Palmer

[The Cellular Basis of Morphogenesis](#) Leon W. Browder, 2012-12-06 This series was established to create comprehensive treatises on specialized topics in developmental biology Such volumes are especially vital in developmental biology since it is a very diverse field that receives contributions from a wide variety of disciplines This series is a meeting ground for the various practitioners of this science facilitating an integration of

heterogeneous information on specific topics Each volume is intended to provide the conceptual basis for a comprehensive understanding of its topic as well as an analysis of the key experiments upon which that understanding is based The specialist in any aspect of developmental biology should understand the experimental background of the field and be able to place that body of information in context to ascertain where additional research would be fruitful At that point the creative process takes over and new experiments are designed This series is intended to be a vital link in that ongoing process of learning and discovery If it facilitates scholarship it will serve an important function

Robert Hilfer, 2012-12-06 The eye has fascinated scientists from the earliest days of biological investigation. The diversity of its parts and the precision of their interaction make it a favorite model system for a variety of developmental studies. The eye is a particularly valuable experimental system not only because its tissues provide examples of fundamental processes but also because it is a prominent and easily accessible structure at very early embryonic ages. In order to provide an open forum for investigators working on all aspects of ocular development, a series of symposia on ocular and visual development was initiated in 1973. A major objective of the symposia has been to foster communication between the basic research worker and the clinician. It is our feeling that much can be learned on both sides from community interaction. The idea for an informal meeting allowing maximum exchange of ideas originated with Dr Leon Candeub who supplied the necessary driving force that made the series a reality. Each symposium has on a different aspect of ocular development. Speakers have been selected to approach related topics from different perspectives.

International Review of Cytology, 1996-01-26 International Review of Cytology presents current advances and comprehensive reviews in cell biology both plant and animal. Articles address structure and control of gene expression, nucleocytoplasmic interactions, control of cell development and differentiation, and cell transformation and growth. Authored by some of the foremost scientists in the field, each volume provides up-to-date information and directions for future research.

Molecular and Cellular Basis of Visual Acuity S.R. Hilfer, J.B. Sheffield, 2012-12-06 The Seventh Symposium on Ocular and Visual Development was held in October 1982. The aim of the meeting was to develop a broad perspective on visual acuity. The subject was discussed initially in terms of molecular events of photoreception and the metabolism of the photoreceptor elements. Subsequent papers presented the development and complexity of the neurocircuitry and transmitter systems in the retina that process the visual information prior to transfer to the brain. The meeting concluded with a series of papers on behavioral and physiological methods of measurement of visual acuity in humans, particularly young children. This volume arose from the papers presented at the meeting. We feel that the juxtaposition of research of broadly differing methodologies will be stimulating rather than daunting and will generate an enhanced understanding of this complex subject. We are indebted to our colleagues Dr M Mote from Temple University and Drs J Siegfried P Dayhaw Barker and L Press from the Pennsylvania College of Optometry for their expertise and assistance in the organization of the meeting to the speakers for their presentations and contributions to this volume and to the reviewers of the manuscripts for their helpful comments. This symposium could not have been held without the generous support of the Temple University College of Arts and Sciences and the Pennsylvania College of Optometry. We also thank Merck Sharp and Dohme Inc for their donation.

Drosophila Eye Development Kevin Moses,2012-12-06 1 Kevin Moses It is now 25 years since the study of the development of the compound eye in *Drosophila* really began with a classic paper Ready et al 1976 In 1864 August Weismann published a monograph on the development of Diptera and included some beautiful drawings of the developing imaginal discs Weismann 1864 One of these is the first description of the third instar eye disc in which Weismann drew a vertical line separating a posterior domain that included a regular pattern of clustered cells from an anterior domain without such a pattern Weismann suggested that these clusters were the precursors of the adult ommatidia and that the line marks the anterior edge of the eye In his first suggestion he was absolutely correct in his second he was wrong The vertical line shown was not the anterior edge of the eye but the anterior edge of a moving wave of patterning and cell type specification that 112 years later 1976 Ready Hansen and Benzer would name the morphogenetic furrow While it is too late to hear from August Weismann it is a particular pleasure to be able to include a chapter in this Volume from the first author of that 1976 paper Don Ready These past 25 years have seen an astonishing explosion in the study of the fly eye see Fig

Molecular Genetics of Axial Patterning, Growth and Disease in Drosophila Eye Amit Singh, Madhuri Kango-Singh, 2020-05-18 *Drosophila melanogaster* fruit fly is a highly versatile model with a genetic legacy of more than a century It provides powerful genetic cellular biochemical and molecular biology tools to address many questions extending from basic biology to human diseases One of the most important questions in biology is how a multi cellular organism develops from a single celled embryo The discovery of the genes responsible for pattern formation has helped refine this question and has led to other questions such as the role of various genetic and cell biological pathways in regulating the process of pattern formation and growth during organogenesis The *Drosophila* eye model has been extensively used to study molecular genetic mechanisms involved in patterning and growth Since the genetic machinery involved in the *Drosophila* eye is similar to humans it has been used to model human diseases and homology to eyes in other taxa This updated second edition covers current progress in the study of molecular genetic mechanisms of pattern formation mutations in axial patterning genetic regulation of growth and more using the *Drosophila* eye as a model
