

Science Behind RF Body Sculpting

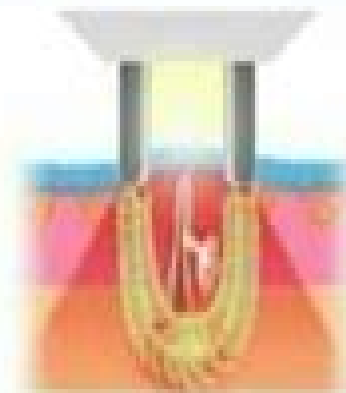

Contact Made with Skin

The epidermis is cooled by the chilled applicator tip, which increases the skin's impedance, further protecting the epidermis and forcing the RF energy to penetrate deeper into the pre-heated, low impedance of the targeted tissue

Energy Pre-heats Target Tissue

The energy is selectively absorbed by the target tissue and converted into thermal energy, thereby preheating the target tissue. There may be a warm sensation felt but this varies from patient to patient.

RF Energy Target Deep Inside Dermis

RF current flows between the electrodes, and a greater preference to pre-heated targets. RF energy is drawn towards the heated target deep inside the dermis, resulting in more thermal impact on the target tissue for effective body sculpting.
