Looking at Plastics John Twigg,1987-06-01 *Book Review Index* ,1987 Every 3rd issue is a quarterly cumulation

How Big is Big and How Small is Small Timothy Paul Smith,2013-10-24 This book is about how big is the universe and how small are quarks and what are the sizes of dozens of things between these two extremes It describes the sizes of atoms and planets quarks and galaxies cells and sequoias It is a romp through forty five orders of magnitude from the smallest sub nuclear particles we have measured to the edge of the observed universe It also looks at time from the epic age of the cosmos to the fleeting lifetimes of ethereal particles It is a narrative that trips its way from stellar magnitudes to the clocks on GPS satellites from the nearly logarithmic scales of a piano keyboard through a system of numbers invented by Archimedes and on to the measurement of the size of an atom Why do some things happen at certain scales Why are cells a hundred thousandths of a meter across Why are stars never smaller than about 100 million meters in diameter Why are trees limited to about 120 meters in height Why are planets spherical but asteroids not Often the size of an object is determined by something simple but quite unexpected The size of a cell and a star depend in part on the ratio of surface area to volume The divide between the size of a spherical planet and an irregular asteroid is the balance point between the gravitational forces and the chemical forces in nature Most importantly with a very few basic principles it all makes sense The world really is a most reasonable place
