Numerical Analysis Pb 1990:

Deconvolution of Images and Spectra Peter A. Jansson, 2014-05-05 Deconvolution is a technique in signal or image processing that is applied to recover information. When it is employed, it is usually because instrumental effects of spreading and blurring have obscured that information. In 1996, *Deconvolution of Images and Spectra* was published by Academic Press as a second edition of Jansson's 1984 book *Deconvolution with Applications in Spectroscopy*. This landmark volume was first published to provide both an overview of the field and practical methods and results. The present Dover edition is a corrected reprinting of the second edition. It incorporates all the advantages of its predecessors by conveying a clear understanding of the field while providing a selection of effective practical techniques. The authors assume only a working knowledge of calculus and emphasize practical applications over topics of theoretical interest, focusing on areas that have been pivotal to the evolution of the most effective methods. This tutorial is essentially self-contained. Readers will find it practical and easy to understand.

Numerical Methods in Matrix Computations Åke Björck, 2014-10-07 Matrix algorithms are at the core of scientific computing and are indispensable tools in most applications in engineering. This book offers a comprehensive and up-to-date treatment of modern methods in matrix computation. It uses a unified approach to direct and iterative methods for linear systems, least squares, and eigenvalue problems. A thorough analysis of the stability, accuracy, and complexity of the treated methods is given. *Numerical Methods in Matrix Computations* is suitable for use in courses on scientific computing and applied technical areas at advanced undergraduate and graduate level. A large bibliography is provided which includes both historical and review papers as well as recent research papers. This makes the book useful also as a reference and guide to further study and research work.

Thermodynamics in Biology Enrico Di Cera, 2000 This book describes several approaches to biological phenomena based on thermodynamics and illustrates the descriptive and predictive power of the laws that govern molecular recognition in biological systems. The current structural emphasis in the study of biological macromolecules provides the motivation for a deeper understanding of the driving forces that determine biological interactions. Because molecular explanations of biological phenomena as inferred from structural information must be informed by and consistent with the laws and principles of thermodynamics, a thorough understanding of biological function requires approaches well balanced between structure and energetics. Topics covered in this book are protein and nucleic acid folding and stability, enzyme-substrate interactions, prediction of the affinity of complexes, electrostatics, and non-equilibrium aspects of protein function. The breadth of the topics covered illustrates the growing importance of thermodynamic approaches in the study of biological phenomena. As more information continues to emerge from structural studies and faster and more accurate computational methods are developed, we will look at biological thermodynamics with renewed interest as a fundamental tool to decipher the rules for specificity and function in proteins and nucleic acids.

Transmission Line Matrix (TLM) Techniques for Diffusion Applications Donard deCogan, 2018-12-12 Transmission Line Matrix (TLM) is a

numerical technique which is based upon establishing an analogue between a space and time dependent physical problem and an electrical network which includes transmission lines By their very nature these enforce time discretization on the network which can then be solved explicitly in the time domain Although it is best known in electromagnetic applications TLM can also be used to model diffusion phenomena and this book outlines the state of the art in this area The first part of the book deals with theory and techniques The second part is devoted to the development of algorithms for specific applications This is arranged as a historical sequence starting with heat flow and matter diffusion The remainder of the book outlines many of the ingenious exploitations of the unique properties of TLM including topics such as the solution of convection Poisson Laplace and time dependent Schrodinger equations Applications in the firing of ceramics chromatography image processing and the solution of inverse thermal problems are also covered

IUTAM Symposium on the Vibration Analysis of Structures with Uncertainties Alexander K. Belyaev, Robin S. Langley, 2010-12-02 The Symposium was aimed at the theoretical and numerical problems involved in modelling the dynamic response of structures which have uncertain properties due to variability in the manufacturing and assembly process with automotive and aerospace structures forming prime examples It is well known that the difficulty in predicting the response statistics of such structures is immense due to the complexity of the structure the large number of variables which might be uncertain and the inevitable lack of data regarding the statistical distribution of these variables The Symposium participants presented the latest thinking in this very active research area and novel techniques were presented covering the full frequency spectrum of low mid and high frequency vibration problems It was demonstrated that for high frequency vibrations the response statistics can saturate and become independent of the detailed distribution of the uncertain system parameters A number of presentations exploited this physical behaviour by using and extending methods originally developed in both phenomenological thermodynamics and in the fields of quantum mechanics and random matrix theory For low frequency vibrations a number of presentations focussed on parametric uncertainty modelling for example probabilistic models interval analysis and fuzzy descriptions and on methods of propagating this uncertainty through a large dynamic model in an efficient way At mid frequencies the problem is mixed and various hybrid schemes were proposed It is clear that a comprehensive solution to the problem of predicting the vibration response of uncertain structures across the whole frequency range requires expertise across a wide range of areas including probabilistic and non probabilistic methods interval and info gap analysis statistical energy analysis statistical thermodynamics random wave approaches and large scale computations and this IUTAM symposium presented a unique opportunity to bring together outstanding international experts in these fields
