Relative Aspects in Representation Theory, Langlands Functoriality and Automorphic Forms Volker Heiermann, Dipendra Prasad, 2018-10-01 This volume presents a panorama of

the diverse activities organized by V Heiermann and D Prasad in Marseille at the CIRM for the Chaire Morlet event during the first semester of 2016. It assembles together expository articles on topics which previously could only be found in research papers. Starting with a very detailed article by P Baumann and S Riche on the geometric Satake correspondence, the book continues with three introductory articles on distinguished representations due to P Broussous, F Murnaghan and O Offen, an expository article of I Badulescu on the Jacquet-Langlands correspondence, a paper of J Arthur on functoriality and the trace formula in the context of Beyond Endoscopy taken from the Simons Proceedings, an article of W W Li attempting to generalize Godement-Jacquet theory, and a research paper of C Moeglin and D Renard applying the trace formula to the local Langlands classification for classical groups. The book should be of interest to students as well as professional researchers working in the broad area of number theory and representation theory.

Lie Theory and Its Applications in Physics

Vladimir Dobrev, 2025-02-27. This volume presents modern trends in the area of symmetries and their applications based on contributions to the workshop Lie Theory and Its Applications in Physics held in Sofia, Bulgaria, in June 2023. Traditionally, Lie theory is a tool to build mathematical models for physical systems. Recently, the trend is towards geometrization of the mathematical description of physical systems and objects. A geometric approach to a system yields, in general, some notion of symmetry which is very helpful in understanding its structure. Geometrization and symmetries are meant in their widest sense, i.e., representation theory, algebraic geometry, number theory, infinite-dimensional Lie algebras and groups, superalgebras and supergroups, groups and quantum groups, noncommutative geometry, symmetries of linear and nonlinear partial differential operators, special functions, and others. Furthermore, the necessary tools from functional analysis are included. This is a large interdisciplinary and interrelated field. The topics covered in this volume from the workshop represent the most modern trends in the field: Representation Theory, Symmetries in String Theories, Symmetries in Gravity Theories, Supergravity, Conformal Field Theory, Integrable Systems, Polylogarithms, and Supersymmetry. They also include Supersymmetric Calogero-type models, Quantum Groups, Deformations, Quantum Computing, and Deep Learning, Entanglement, Applications to Quantum Theory, and Exceptional Quantum Algebra for the standard model of particle physics. This book is suitable for a broad audience of mathematicians, mathematical physicists, and theoretical physicists, including researchers and graduate students interested in Lie Theory.

The Higher Infinite Akihiro Kanamori, 2008-11-23

Over the years, this book has become a standard reference and guide in the set theory community. It provides a comprehensive account of the theory of large cardinals from its beginnings and some of the direct outgrowths leading to the frontiers of contemporary research with open questions and speculations throughout.

On Thom Spectra, Orientability, and Cobordism Yu. B. Rudyak, 2007-12-12

Rudyak's groundbreaking monograph is the first guide on the subject of cobordism since Stong's influential notes of a generation ago. It concentrates on Thom spaces, spectra, orientability theory, and cobordism theory, including cobordism with singularities and, in particular, Morava K-theories. These are all framed by co-

homology theories and spectra The author has also performed a service to the history of science in this book giving detailed attributions

Modern Methods in the Calculus of Variations Irene Fonseca, Giovanni Leoni, 2007-08-22 This is the first of two books on methods and techniques in the calculus of variations Contemporary arguments are used throughout the text to streamline and present in a unified way classical results and to provide novel contributions at the forefront of the theory This book addresses fundamental questions related to lower semicontinuity and relaxation of functionals within the unconstrained setting mainly in L^p spaces It prepares the ground for the second volume where the variational treatment of functionals involving fields and their derivatives will be undertaken within the framework of Sobolev spaces This book is self contained All the statements are fully justified and proved with the exception of basic results in measure theory which may be found in any good textbook on the subject It also contains several exercises Therefore it may be used both as a graduate textbook as well as a reference text for researchers in the field Irene Fonseca is the Mellon College of Science Professor of Mathematics and is currently the Director of the Center for Nonlinear Analysis in the Department of Mathematical Sciences at Carnegie Mellon University Her research interests lie in the areas of continuum mechanics calculus of variations geometric measure theory and partial differential equations Giovanni Leoni is also a professor in the Department of Mathematical Sciences at Carnegie Mellon University He focuses his research on calculus of variations partial differential equations and geometric measure theory with special emphasis on applications to problems in continuum mechanics and in materials science

Algebraic Cobordism Marc Levine, Fabien Morel, 2007-02-23 Following Quillen's approach to complex cobordism the authors introduce the notion of oriented cohomology theory on the category of smooth varieties over a fixed field They prove the existence of a universal such theory in characteristic 0 called Algebraic Cobordism The book also contains some examples of computations and applications

Methods in Nonlinear Analysis Kung Ching Chang, 2005-08-26 This book offers a systematic presentation of up to date material scattered throughout the literature from the methodology point of view It reviews the basic theories and methods with many interesting problems in partial and ordinary differential equations differential geometry and mathematical physics as applications and provides the necessary preparation for almost all important aspects in contemporary studies All methods are illustrated by carefully chosen examples from mechanics physics engineering and geometry
