Pupolin, 2007-12-18 The 18th Tyrrhenian Workshop on digital communications is devoted to wireless communications. In the last decade, wireless communications research boosted launching new standards and proposing new techniques for the next technology. We moved from the UTRA standard capable to transmit 0.5 bit/s/Hz to WLAN which is promising 2.7 bit/s/Hz. Now wireless communication systems are facing a flourishing of new proposals moving from multiple antennas at transmitter and receiver side MIMO systems to new powerful Forward Error Correction Codes to adapt to radio resource management algorithms. The new challenge, however, is the move towards multimedia communications and IP technology. This move implies efforts in several new aspects. First of all, an open network as IP imposes the necessity of a secure network to guarantee the privacy of the ongoing communications, avoid the use of the networks by unauthorized customers, avoid the misuses and the charge to third parties of the cost of the connection. Also, quality of service (QoS) of the communications is becoming a must in IP networks which are carrying services which need a guaranteed QoS as telephony, real time services, etc. To get this new target, some form of access control to the network must be set up. Recently, a new form of communication networks has appeared to collect data for several applications: sensor networks, ad hoc networks, etc., and they need a connection with a backbone network which could be a wireless one with a larger range than the sensor or ad hoc networks.

OFDM for Optical Communications William Shieh, Ivan B. Djordjevic, 2009-09-18 The first book on optical OFDM by the leading pioneers in the field. The only book to cover error correction codes for optical OFDM. Gives applications of OFDM to free space communications, optical access networks, and metro and long haul transports. Shows optical OFDM can be implemented. Contains introductions to signal processing for optical engineers and optical communication fundamentals for wireless engineers. This book gives a coherent and comprehensive introduction to the fundamentals of OFDM signal processing with a distinctive focus on its broad range of applications. It evaluates the architecture design and performance of a number of OFDM variations, discusses coded OFDM, and gives a detailed study of error correction codes for access networks, 100 Gb/s Ethernet, and future optical networks. The emerging applications of optical OFDM including single mode fiber transmission, multimode fiber transmission, free space optical systems, and optical access networks are examined with particular attention paid to passive optical networks, radio over fiber, WiMAX, and UWB communications. Written by two of the leading contributors to the field, this book will be a unique reference for optical communications engineers and scientists. Students, technical managers, and telecom executives seeking to understand this new technology for future generation optical networks will find the book invaluable. William Shieh is an associate professor and reader in the electrical and electronic engineering department, The University of Melbourne, Australia. He received his M.S. degree in electrical engineering and Ph.D. degree in physics both from University of Southern California.
