Protein Function Prediction for Omics Era Daisuke Kihara, 2011-04-19 Gene function annotation has been a central question in molecular biology The importance of computational function prediction is increasing because more and more large scale biological data including genome sequences protein structures protein protein interaction data microarray expression data and mass spectrometry data are awaiting biological interpretation Traditionally when a genome is sequenced function annotation of genes is done by homology search methods such as BLAST or FASTA However since these methods are developed before the genomics era conventional use of them is

not necessarily most suitable for analyzing a large scale data Therefore we observe emerging development of computational gene function prediction methods which are targeted to analyze large scale data and also those which use such omics data as additional source of function prediction In this book we overview this emerging exciting field The authors have been selected from 1 those who develop novel purely computational methods 2 those who develop function prediction methods which use omics data 3 those who maintain and update data base of function annotation of particular model organisms E coli which are frequently referred

Geometric Techniques for Molecular Shape Analysis Michael A. Facello,1996 Abstract Macromolecules such as proteins and DNA have complex spatial structures which are often important for their biological functions The idea of molecular shape and shape complementarity play crucial roles in protein folding conformational stability molecular solubility crystal packing and docking Various models based on a union of balls representation have been suggested for representing molecular shape including the van der Waals model the solvent accessible surface and the molecular surface In this thesis we present several extensions to the theory of Alpha shapes applicable to the analysis of molecular shape First we define a pocket of a molecule which is intuitively a depression canyon or cavity of a molecule The definition is based on mathematical notions of relative distance We give efficient algorithms for computing pockets and examples of their application Secondly we look at the issue of maintaining shape dynamically as a molecule changes over time Topological analysis of the changing structure can yield information about the function of the molecule We describe algorithms and their implementations for dynamically maintaining the Delaunay complex the basis for shape analysis These algorithms have been implemented and experimental results are reported Finally we discuss techniques for modelling uniform growth of the atoms of a molecule The solvent accessible and molecular surface models of a molecule are based on such growth and the algorithms presented here efficiently compute these models for all probe sizes
