Message Handling Systems:

Message Handling Systems Michael Debenham, 1990-09-01 **Message Handling Systems** Robert C. Speth, Rolf Speth, 1988 The aim of this conference was to present a state of the art picture in the area of message handling systems and to provide a forum for presenting and discussing future directions in research and development in this area In recent years message handling has developed rapidly for various reasons One is that the growth of national and international networks has stimulated experimentation with the introduction of new distributed applications of which message handling is a prominent and perhaps the most important one Another reason is that a basic standard for distributed messaging the CCITT X 400 series of recommendations provided a solid foundational framework not only for related development of products and services in the industrial domain but also for research into new concepts to integrate more powerful and sophisticated message related features into distributed interworking A third reason is that the remarkable progress in personal computing equipment in terms of capabilities and also with respect to cost reduction stimulated the use of computer based methods for human communications At this conference two main types of reports and discussions could be identified On the one hand there were the issues of interworking between X 400 systems their interconnection and interworking with existing non X 400 systems and related problems e g naming addressing directory issues and X 400 conformance testing On the other hand a larger set of reports addressed group communication with its various aspects of modelling concepts storage and retrieval facilities and office procedures Another feature of the workshop was that a number of parallel workshops were conducted to discuss state of the art and possible future activities their summary reports being found in this volume **Message Handling Systems and Application Layer Communication Protocols** Pietro Schicker, Einar Stefferud, 1991 Protocols related to message handling systems and application layer communication protocols in general will continue to enjoy rapid development in the near future Demonstrations of data communication between different vendors application systems have become commonplace A tidal wave of OSI application products and services appears to be cresting now with the promise of a flood throughout the 1990 s The research papers in this book look at various aspects of this rush of development The role of security be it for authentication validation provision of privacy or for the preservation of integrity is a major focus of interest Other sections present recent work on implementations and experiences with the operation of MHS and Directory networks with extensions into new application areas *Networking Security and Standards* Weidong Kou, 1997-03-31 Security is the science and technology of secure communications and resource protection from security violation such as unauthorized access and modification Putting proper security in place gives us many advantages It lets us exchange confidential information and keep it confidential We can be sure that a piece of information received has not been changed Nobody can deny sending or receiving a piece of information We can control which piece of information can be accessed and by whom We can know when a piece of information was accessed and by whom Networks and databases are guarded against unauthorized

access We have seen the rapid development of the Internet and also increasing security requirements in information networks databases systems and other information resources This comprehensive book responds to increasing security needs in the marketplace and covers networking security and standards There are three types of readers who are interested in security non technical readers general technical readers who do not implement security and technical readers who actually implement security This book serves all three by providing a comprehensive explanation of fundamental issues of networking security concept and principle of security standards and a description of some emerging security technologies The approach is to answer the following questions 1 What are common security problems and how can we address them 2 What are the algorithms standards and technologies that can solve common security problems 3

Computer Communications and Networks John R. Freer,2012-12-06 Computer communications is one of the most rapidly developing technologies and it is a subject with which everyone in the computer systems profession should be familiar Computer

communications and networks is an introduction to communications technology and system design for practising and aspiring computer professionals. The subject is described from the computer system designer's point of view rather than from the communications engineer's viewpoint. The presentation is suitable for introductory reading as well as for reference. The emphasis is on practical rather than theoretical aspects and on technology which will become more important in the future. The majority of the subject matter applies to civil and military communications but some aspects which are unique to military applications have been included where considered significant. Computer communications is a rapidly changing and highly complex subject. Sufficient practical knowledge of the subject is not usually gained at university or college but is generally developed over a period of several years by trial and error, attending courses, reading reference books and journals. This book attempts to simplify and speed up the process by bringing together a body of information which is otherwise distributed throughout many books and journals. The information is presented in a framework which makes a wider understanding of the subject possible. Basic knowledge of communications is assumed. A general familiarity with computer systems is anticipated in later chapters and where relevant theory is explained.

Planning and Architectural Design of Modern Command Control Communications and Information Systems A. Nejat Ince, Cem Evrendilek, Dag Wilhelmsen, Fadi Gezer, 2012-12-06. The subject of this book is Command Control Communication and Information (3 C I) which is the management infrastructure for any large or complex dynamic resource systems. Here command means the determination of what to do and control means the ongoing management of the execution of a command. 3 Decision making is the essence of C I which is accomplished through a phased implementation of a set of facilities, communications, personnel, equipment and procedures for monitoring, forecasting, planning, directing, allocating resources and generating options to achieve specific and general objectives. 3 The C I system that is in question here is for a strategic military command including its subordinate commands. Although the design methodology that will be expounded in the book is for a military system, it can to a large extent apply also to tactical military as well as to civilian management information systems. MIS 3 A C I system is a decision making network that reflects a hierarchical organization of C I nodes. Each node is responsible for the management of some portion of the available resources where the higher level nodes are responsible for a correspondingly greater portion of the resources. Within a C I system both command and control decision making occur at every level of the hierarchy. Command decisions at one level determine how to satisfy the management decisions at a higher level.
