Handbook of Metaheuristics Michel Gendreau, Jean-Yves Potvin, 2018-09-20 The third edition of this handbook is designed to provide a broad coverage of the concepts implementations and applications in metaheuristics The book's chapters serve as stand alone presentations giving both the necessary underpinnings as well as practical guides for implementation The nature of metaheuristics invites an analyst to modify basic methods in response to problem characteristics past experiences and personal preferences and the chapters in this handbook are designed to facilitate this process as well This new edition has been fully revised and features new chapters on swarm intelligence and automated design of metaheuristics from flexible algorithm frameworks The authors who have contributed to this volume represent leading figures from the metaheuristic community and are responsible for pioneering contributions to the fields they write about Their collective work has significantly enriched the field of optimization in general and combinatorial optimization in particular Metaheuristics are solution methods that orchestrate an interaction between local improvement procedures and higher level strategies to create a process capable of escaping from local optima and performing a robust search of a solution space In addition many new and exciting developments and extensions have been observed in the last few years Hybrids of metaheuristics with other optimization techniques like branch and bound mathematical programming or constraint programming are also increasingly popular On the front of applications metaheuristics are now used to find high quality solutions to an ever growing number of complex ill defined real world problems in particular combinatorial ones This handbook should continue to be a great reference for researchers graduate students as well as practitioners interested in metaheuristics

Parallel Problem Solving from Nature - PPSN IX Thomas Philip Runarsson, 2006-09-13 This book constitutes the refereed proceedings of the 9th International Conference on Parallel Problem Solving from Nature PPSN 2006 The book presents 106 revised full papers covering a wide range of topics from evolutionary computation to swarm intelligence and bio inspired computing to real world applications These are organized in topical sections on theory new algorithms applications multi objective optimization evolutionary learning as well as representations operators and empirical evaluation Theory and Algorithms for Cooperative Systems Don Grundel, Robert Murphey, Panos M. Pardalos, 2004 Over the past several years cooperative control and optimization have increasingly played a larger and more important role in many aspects of military sciences biology communications robotics and decision making At the same time cooperative systems are notoriously difficult to model analyze and solve while intuitively understood they are not axiomatically defined in any commonly accepted manner The works in this volume provide outstanding insights into this very complex area of research They are the result of invited papers and selected presentations at the Fourth Annual Conference on Cooperative Control and Optimization held in Destin Florida November 2003 This book has been selected for coverage in Index to Scientific Technical Proceedings ISTP ISI Proceedings Index to Scientific Technical Proceedings ISTP CDROM version ISI Proceedings CC Proceedings Engineering Physical Sciences Modeling, Analysis, and Applications in Metaheuristic Computing: Advancements and Trends Yin, Peng-Yeng, 2012-03-31 This book is a collection of the latest developments models and applications within the transdisciplinary fields related to metaheuristic computing providing readers with insight into a wide range of topics such as genetic algorithms differential evolution and ant colony optimization Provided by publisher Heuristics and Hyper-Heuristics Javier Del Ser Lorente, 2017-08-30 In the last few years the society is witnessing ever growing levels of complexity in the optimization paradigms lying at the core of different applications and processes This augmented complexity has motivated the adoption of heuristic methods as a means to balance the Pareto trade off between computational efficiency and the quality of the produced solutions to the problem at hand The momentum gained by heuristics in practical applications spans further towards hyper heuristics which allow constructing ensembles of simple heuristics to handle efficiently several problems of a single class In this context this short book compiles selected applications of heuristics and hyper heuristics for combinatorial optimization problems including scheduling and other assorted application scenarios

Production Scheduling Pierre Lopez, François Roubellat, 2013-03-01 The performance of an company depends both on its technological expertise and its managerial and organizational effectiveness Production management is an important part of the process for manufacturing firms The organization of production relies in general on the implementation of a certain number of basic functions among which the scheduling function plays an essential role This title presents recently developed methods for resolving scheduling issues The basic concepts and the methods of production scheduling are introduced and advanced techniques are discussed providing readers with a comprehensive and accessible guide to employing this process

Practice and Theory of Automated Timetabling V Edmund Burke, Michael Trick, 2005

Understanding Autonomous Cooperation and Control in Logistics Michael Hülsmann, Katja Windt, 2007-06-30 One of the great challenges in flexible production and supply chains is the availability of necessary information at any time and any place. As a result of increasing dynamical and structural complexity of structures and processes in production, it is often impossible to make all necessary information available to a central instance in real time and to perform appropriate measures of control in terms of a defined target system. A fast and flexible adaptation to changing basic conditions ought to be achieved by establishing autonomous logistics processes. In this context, several fundamental questions concerning autonomous cooperating logistics processes were investigated: The identification problem: What are autonomous logistics processes and how do they differ from conventionally managed processes? The description problem: Which changes will autonomy cause in order processing? One of the first results is a definition for the term autonomy for applications in engineering science. The constituent characteristics of this definition were considered within the development of the catalogue of criteria in order to describe autonomous logistic processes. Regarding the modelling of autonomous processes, first requirements for modelling methods were specified. To validate the research results, a production logistic shop floor scenario and a practical scenario based on the real business processes of an automobile terminal were developed. Simulation studies concerning autonomously controlled allocation of parking areas document comprehensive opportunities for improvement.

Intuitionistic and Type-2 Fuzzy Logic Enhancements in Neural and Optimization Algorithms: Theory and Applications Oscar Castillo, Patricia Melin, Janusz Kacprzyk, 2020-02-27 This book describes the latest advances in fuzzy logic neural networks and optimization algorithms as well as their hybrid intelligent combinations and their applications in the areas such as intelligent control, robotics, pattern recognition, medical diagnosis, time series prediction, and optimization. Advances in Computational Intelligence in Transport, Logistics, and Supply Chain Management

Andreas Fink, Franz Rothlauf, 2008-09-08 Logistics and supply chain management deal with managing the flow of goods or services within a company from suppliers to customers and along a supply chain where companies act as suppliers as well as customers As transportation is at the heart of logistics the design of traffic and transportation networks combined with the routing of vehicles and goods on the networks are important and demanding planning tasks The influence of transport logistics and supply chain management on the modern economy and society has been growing steadily over the last few decades The worldwide division of labor the connection of distributed production centers and the increased mobility of individuals lead to an increased demand for efficient solutions to logistics and supply chain management problems On the company level efficient and effective logistics and supply chain management are of critical importance for a company's success and its competitive advantage Proper performance of the logistics functions can contribute both to lower costs and to enhanced customer service Computational Intelligence CI describes a set of methods and tools that often mimic biological or physical principles to solve problems that have been difficult to solve by classical mathematics CI embodies neural networks fuzzy logic evolutionary computation local search and machine learning approaches Researchers that work in this area often come from computer science operations research or mathematics as well as from many different engineering disciplines Popular and successful CI methods for optimization and planning problems are heuristic optimization approaches such as evolutionary algorithms local search methods and other types of guided search methods
