Metalliferous Sediments Of The World Ocean Fundamental Theory Of Deepsea Hydrothermal Sedimentation:

Metalliferous Sediments of the World Ocean Evgeny G. Gurvich, 2006-01-16 Dramatic advances in understanding global tectonics have been made in the last half century and the information and specific data acquired on the floor of the World Ocean by the scientific community probably has exceeded that available in all previous time. With the benefit of new technology and advanced concepts in the earth sciences, extensive exploration of the deep seabed became possible and has been carried out in many parts of the world. Many features have been recognized and data recorded that are vital for understanding the fundamental processes that shape the earth's surface and control the habitable environment. The data collected to date on the ocean floor and its physical environment greatly exceeds our understanding and appreciation of their fundamental importance in the earth sciences and our ability to apply this knowledge effectively in improving our way of life. With his extensive scientific knowledge and unique experience from many cruises in association with scientists throughout the world, Dr. Evgeny Gurvich has made an outstanding contribution in acquiring basic data on hydrothermal and sedimentation processes in the ocean as well as in the synthesis of data and concepts available from cruise reports and an extensive literature.

Metagenomics and Microbial Ecology Surajit De Mandal, Amrita Kumari Panda, N. Senthil Kumar, Satpal Singh Bisht, Fengliang Jin, 2021-11-29 Microorganisms comprise the greatest genetic diversity in the natural ecosystem and characterization of these microbes is an essential step towards discovering novel products or understanding complex biological mechanisms. The advancement of metagenomics coupled with the introduction of high throughput, cost-effective NGS technology has expanded the possibilities of microbial research in various biological systems. In addition to traditional culture and biochemical characteristics, omics approaches—metagenomics, metaproteomics, and metatranscriptomics—are useful for analyzing complete microbial communities and their functional attributes in various environments. *Metagenomics and Microbial Ecology: Techniques and Applications* explores the most recent advances in metagenomics research in the landscape of next-generation sequencing technologies. This book also describes how advances in sequencing technologies are used to study invisible microbes as well as the relationships between microorganisms in their respective environments. **Features:** Covers a wide range of concepts, investigations, and technological advancement in metagenomics at the global level. Highlights the novel and recent approaches to analyze microbial diversity and its functional attributes. Features a range of chapters that present an introduction to the field and functional insight into various ecosystems. **Extremophiles** Ravi V. Durvasula, D. V. Subba Rao, 2018-01-09 Highly recommended by CHOICE Oct 2018. Extremophiles are nature's ultimate survivors thriving in environments ranging from the frozen Antarctic to abyssal hot hydrothermal vents. Their lifeforms span bacteria to fishes and are categorized as halophiles from hypersaline environments, acidophiles from acidic waters, psychrophiles from cold habitats, and thermophiles from warm waters. *Extremophiles: From Biology to Biotechnology* comprehensively covers the basic biology, physiology, habitats, secondary metabolites for bioprospecting, and biotechnology of

these extreme survivors The chapters focus on the novel genetic and biochemical traits that lend these organisms to biotechnological applications Couples studies of marine extremophile biology genomics and extremophile culture for biotechnological applications with the latest advances in bio prospecting and bio product development Includes practical experiments that a laboratory can use to replicate extreme habitats for research purposes Presents latest advances in extremophile genomics to give the reader a better understanding of the regulatory mechanisms of extremophiles Offers insights into the production of commercially important extremozymes carotenoids bioactive compounds and secondary metabolites of medicinal value This unique guide serves as a resource for biotechnologists who wish to explore extremophiles for their commercial potential as well as a valuable reference for teaching undergraduate graduate and postgraduate students

The Proceedings from Halophiles 2013, the International Congress on Halophilic Microorganisms R. Thane Papke,Aharon Oren,Antonio Ventosa,Jesse Dillon,2015-07-08 The Halophiles 2013 meeting is a multidisciplinary international congress with a strong history of regular triennial meetings since 1978 Our mission is to bring researchers from a wide diversity of investigation interests e g protein and species evolution niche adaptation ecology taxonomy genomics metagenomics horizontal gene transfer gene regulation DNA replication repair and recombination signal transduction community assembly and species distribution astrobiology biotechnological applications adaptation to radiation desiccation osmotic stress into a single forum for the integration and synthesis of ideas and data from all three domains of life and their viruses yet from a single environment salt concentrations greater than seawater This cross section of research informs our understanding of the microbiological world in many ways The halophilic environment is extreme especially above 10% NaCl restricting life solely to microbes The microorganisms that live there are adapted to extreme conditions and are notable for their ability to survive high doses of radiation and desiccation Therefore the hypersaline environment is a model system both the abiotic and biologic factors for insightful understanding regarding conditions and life in the absence of plant and animals e g life on the early earth and other solar system bodies like Mars and Europa Lower salinity conditions e g 6 10% NaCl form luxuriant microbial mats considered modern analogues of fossilized stromatolites which are enormous microbially produced structures fashioned during the Precambrian and still seen today in places like Shark s Bay Australia Hypersaline systems are island like habitats spread patchily across the earth s surface and similar to the Galapagos Islands represent unique systems excellent for studying the evolutionary pressures that shape microbial community assembly adaptation and speciation The unique adaptations to this extreme environment produce valuable proteins enzymes and other molecules capable of remediating harsh human instigated environments and are useful for the production of biofuels vitamins and retinal implants for example This research topic is intended to capture the breadth and depth of these topics Seafloor processes: Geomorphology, sediment-ocean interaction and natural resources Jiangxin Chen,Leonardo Azevedo,Wei Li,Min Luo,2023-11-01 *Bioactive Natural Products from the Red Sea* Mostafa Rateb,Usama Ramadan Abdelmohsen,2021-09-08

This book describes the recent advances in natural product chemistry and biodiversity in the Red Sea. All previous marine natural products isolated from different Red Sea organisms and microbes were collected in a comprehensive review. Additionally, newly discovered marine natural products and their biological activities are described. **Giant Metallic Deposits** Peter Laznicka, 2010-09-02. Metals in the earth's crust are very unevenly distributed and traditionally a small number of ore deposit districts or countries have dominated the world supply and have influenced commodity prices. The importance of exceptionally large or rich deposits has greatly increased in the age of globalization when a small number of international corporations dominate the metals market based on few very large ore deposits practically anywhere in the world. Search for giant orebodies thus drives the exploration industry not only the in-house teams of large internationals but also hundreds of junior companies hoping to sell their significant discoveries to the big boys. Geological characteristics of giant metallic deposits and their setting and the politico-economic constraints of access to and exploitation in prospective areas have been a hot topic in the past fifteen years but the knowledge generated and published has been one-sided, scattered and fragmented. This is the first comprehensive book on the subject that provides a body of solid facts rather than rapidly changing theories written by the author of the Empirical Metallogeny book series and founder of the Data Metallogenica visual knowledge system on mineral deposits of the world who has had an almost 40 years long international academic and industrial experience. The book will provide abundant material for comparative research in metallogeny, practical information for the explorationists as to where to look for the elephants and some inspiration for commodity investors. **Geological Setting, Palaeoenvironment and Archaeology of the Red Sea** Najeeb M.A. Rasul, Ian C.F. Stewart, 2018-12-05. This book gathers invited contributions from active researchers to provide an up-to-date overview of the geological setting of the Red Sea. It discusses aspects ranging from historical information to modern research in the Red Sea and presents findings from rapidly advancing emerging fields. This semi-enclosed young ocean basin provides a unique opportunity to study the development of passive continental margins in order to examine the current status of that region. In addition to studies on the Sea itself, it includes those from related fields on the littoral zone. The book is of interest to geoscientists and non-specialists alike. **The Red Sea** Najeeb M.A. Rasul, Ian C.F. Stewart, 2015-04-02. This book presents a broad overview of the current state of knowledge regarding the Red Sea from its geological formation and oceanographic development to the environmental influences on its ecology and the changes it is experiencing due to the rapid development of its coastlines and role as one of the world's major transport routes. The book gathers invited contributions from researchers with an interest in the geology, geophysics, oceanography and environment of the Red Sea while also providing comprehensive new data and a complete review of the literature. It will be of interest not only to researchers actively studying the sea and its surroundings but will also appeal to all those involved in planning and managing the Red Sea, its environment, its resources and the countries which rely on its existence. **Adaption of Microbial Life to Environmental Extremes** Helga

Stan-Lotter, Sergiu Fendrihan, 2017-03-02 This entirely updated second edition provides an overview on the biology ecology and biodiversity of extremophiles Unusual and less explored ecosystems inhabited by extremophiles such as marine hypersaline deeps extreme cold desert sands and man made clean rooms for spacecraft assembly are presented An additional focus is put on the role of these highly specialized microorganism in applied research fields ranging from biotechnology and nanotechnology to astrobiology Examples such as novel psychrophilic enzymes compounds from halophiles and detection strategies for potential extraterrestrial life forms are discussed in detail The book addresses researchers and advanced students in the fields of microbiology microbial ecology and biotechnology
