ABSTRACT

Digital watermarking is a method of identifying the rightful owner of digital data by embedding a known message in the data. These methods can be applied to a wide range of digital material, including still images, videos, and music. To safeguard the copyright of digital media, digital watermarking techniques have been created. This study seeks to provide a comprehensive overview and background on the definition, idea, and major accomplishments in the subject of watermarking. It starts with a broad review of digital watermarking, then moves on to assaults, applications, and eventually a detailed examination of existing and new watermarking systems. We classify the techniques according to various categories such as host signal, perceptivity, and robustness, and watermark type, necessary data for extraction, processing domain, and applications.

KEYWORDS: Watermarking, Digital Video Watermarking, Spatial Domain, Frequency Domain, Copy Right Protection

INTRODUCTION

Watermarking

Watermarking is characterised as the action by which a message, text, logo or signature is concealed in an image, audio file, video or other media work. For quite a long time, actually for many decades, these activities have existed. The field of digital watermarking is relatively young and gained attention in the latter half of the 1990s as a research subject.

Watermarking may be noticeable, such as the pictures on money notes are printed, or invisible, for which the media covers the watermark. Examples include fabrics, clothing labels, and product packaging that can be watermarked using special invisible dyes and inks, or as electronic signals. Watermarking can be extended to physical items. Popular types of signals that can be watermarked include examples of electronic representations of audio, images, and video. The dissertation focuses on invisible watermarks using electronic signals in this study. The job of the watermark consists of an initial un-watermarked media, called the cover or host media (also known as the media representing or transmitting) and secret material (the watermark).

Watermarking is characterised as the process by which a message is imperceptibly embedded in the host by some suitable means. It is possible to characterise a watermarking device as a structure that contains two parts: an embedding component and a detector component. Two inputs are taken from the embedding portion. One is the message that we want to encode as a watermark, and the other is the work of the host or cover that we want to embed the mark into. The job with the watermark is transmitted. By using the detector, which decides whether or not the watermark exists, the embedded message can be retrieved. Digital watermarking, including identification of the copyright owner and defence, is used to give ownership protections.

Digital Watermarking

By comparing it to a traditional paper watermark, a digital watermark is best described. To provide proof of authenticity, traditional watermarks are applied to some types of document. They are imperceptible, not even when the document for inspection is held up to a light. Similarly, in a way that can be seen by a device
