Meromorphic Functions And Projective Curves:

Meromorphic Functions and Projective Curves Kichoon Yang, 2014-09-01 **Algebraic Curves and Riemann Surfaces**

Rick Miranda, 1995 In this book Miranda takes the approach that algebraic curves are best encountered for the first time over the complex numbers where the reader's classical intuition about surfaces, integration and other concepts can be brought into play. Therefore many examples of algebraic curves are presented in the first chapters. In this way the book begins as a primer on Riemann surfaces with complex charts and meromorphic functions taking centre stage. But the main examples come from projective curves and slowly but surely the text moves toward the algebraic category. Proofs of the Riemann-Roch and Serre Duality Theorems are presented in an algebraic manner via an adaptation of the adelic proof expressed completely in terms of solving a Mittag-Leffler problem. Sheaves and cohomology are introduced as a unifying device in the later chapters so that their utility and naturalness are immediately obvious. Requiring a background of one term of complex variable theory and a year of abstract algebra, this is an excellent graduate textbook for a second term course in complex variables or a year-long course in algebraic geometry. *Complex Algebraic Curves* Frances Clare

Kirwan, 1992-02-20 This development of the theory of complex algebraic curves was one of the peaks of nineteenth century mathematics. They have many fascinating properties and arise in various areas of mathematics from number theory to theoretical physics and are the subject of much research. By using only the basic techniques acquired in most undergraduate courses in mathematics, Dr Kirwan introduces the theory, observes the algebraic and topological properties of complex algebraic curves and shows how they are related to complex analysis. **Algebraic Curves** Maxim E. Kazaryan, Sergei K. Lando, Victor V. Prasolov, 2019-01-21

This book offers a concise yet thorough introduction to the notion of moduli spaces of complex algebraic curves. Over the last few decades, this notion has become central not only in algebraic geometry but in mathematical physics including string theory as well. The book begins by studying individual smooth algebraic curves including the most beautiful ones before addressing families of curves. Studying families of algebraic curves often proves to be more efficient than studying individual curves; these families and their total spaces can still be smooth even if there are singular curves among their members. A major discovery of the 20th century attributed to P. Deligne and D. Mumford was that curves with only mild singularities form smooth compact moduli spaces. An unexpected byproduct of this discovery was the realization that the analysis of more complex curve singularities is not a necessary step in understanding the geometry of the moduli spaces. The book does not use the sophisticated machinery of modern algebraic geometry and most classical objects related to curves such as Jacobian space of holomorphic differentials, the Riemann-Roch theorem and Weierstrass points are treated at a basic level that does not require a profound command of algebraic geometry but which is sufficient for extending them to vector bundles and other geometric objects associated to moduli spaces. Nevertheless, it offers clear information on the construction of the moduli spaces and provides readers with tools for practical operations with this notion. Based on

several lecture courses given by the authors at the Independent University of Moscow and Higher School of Economics the book also includes a wealth of problems making it suitable not only for individual research but also as a textbook for undergraduate and graduate coursework *Geometrical Methods for the Theory of Linear Systems* C.I. Byrnes, C.F. Martin, 2012-12-06 The lectures contained in this book were presented at Harvard University in June 1979 The workshop at which they were presented was the third such on algebro geometric methods The first was held in 1973 in London and the emphasis was largely on geometric methods The second was held at Ames Research Center NASA in 1976 There again the emphasis was on geometric methods but algebraic geometry was becoming a dominant theme In the two years after the Ames meeting there was tremendous growth in the applications of algebraic geometry to systems theory and it was becoming clear that much of the algebraic systems theory was very closely related to the geometric systems theory On this basis we felt that this was the right time to devote a workshop to the applications of algebra and algebraic geometry to linear systems theory The lectures contained in this volume represent all but one of the tutorial lectures presented at the workshop The lecture of Professor Murray Wonham is not contained in this volume and we refer the interested to the archival literature This workshop was jointly sponsored by a grant from Ames Research Center NASA and a grant from the Advanced Study Institute Program of NATO We greatly appreciate the financial support rendered by these two organizations The American Mathematical Society hosted this meeting as part of their Summer Seminars in Applied Mathematics and will publish the companion volume of contributed papers **Elliptic Curves (Second Edition)** James S Milne, 2020-08-20 This book uses the beautiful theory of elliptic curves to introduce the reader to some of the deeper aspects of number theory It assumes only a knowledge of the basic algebra complex analysis and topology usually taught in first year graduate courses An elliptic curve is a plane curve defined by a cubic polynomial Although the problem of finding the rational points on an elliptic curve has fascinated mathematicians since ancient times it was not until 1922 that Mordell proved that the points form a finitely generated group There is still no proven algorithm for finding the rank of the group but in one of the earliest important applications of computers to mathematics Birch and Swinnerton Dyer discovered a relation between the rank and the numbers of points on the curve computed modulo a prime Chapter IV of the book proves Mordell's theorem and explains the conjecture of Birch and Swinnerton Dyer Every elliptic curve over the rational numbers has an L series attached to it Hasse conjectured that this L series satisfies a functional equation and in 1955 Taniyama suggested that Hasse's conjecture could be proved by showing that the L series arises from a modular form This was shown to be correct by Wiles and others in the 1990s and as a consequence one obtains a proof of Fermat's Last Theorem Chapter V of the book is devoted to explaining this work The first three chapters develop the basic theory of elliptic curves For this edition the text has been completely revised and updated **Rigid Geometry of Curves and Their Jacobians** Werner Lütkebohmert, 2016-01-26 This book presents some of the most important aspects of rigid geometry namely its applications to the study of smooth algebraic

curves of their Jacobians and of abelian varieties all of them defined over a complete non archimedean valued field The text starts with a survey of the foundation of rigid geometry and then focuses on a detailed treatment of the applications In the case of curves with split rational reduction there is a complete analogue to the fascinating theory of Riemann surfaces In the case of proper smooth group varieties the uniformization and the construction of abelian varieties are treated in detail Rigid geometry was established by John Tate and was enriched by a formal algebraic approach launched by Michel Raynaud It has proved as a means to illustrate the geometric ideas behind the abstract methods of formal algebraic geometry as used by Mumford and Faltings This book should be of great use to students wishing to enter this field as well as those already working in it

Encyclopaedia of Mathematics Michiel Hazewinkel, 2012-12-06 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977 1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions
